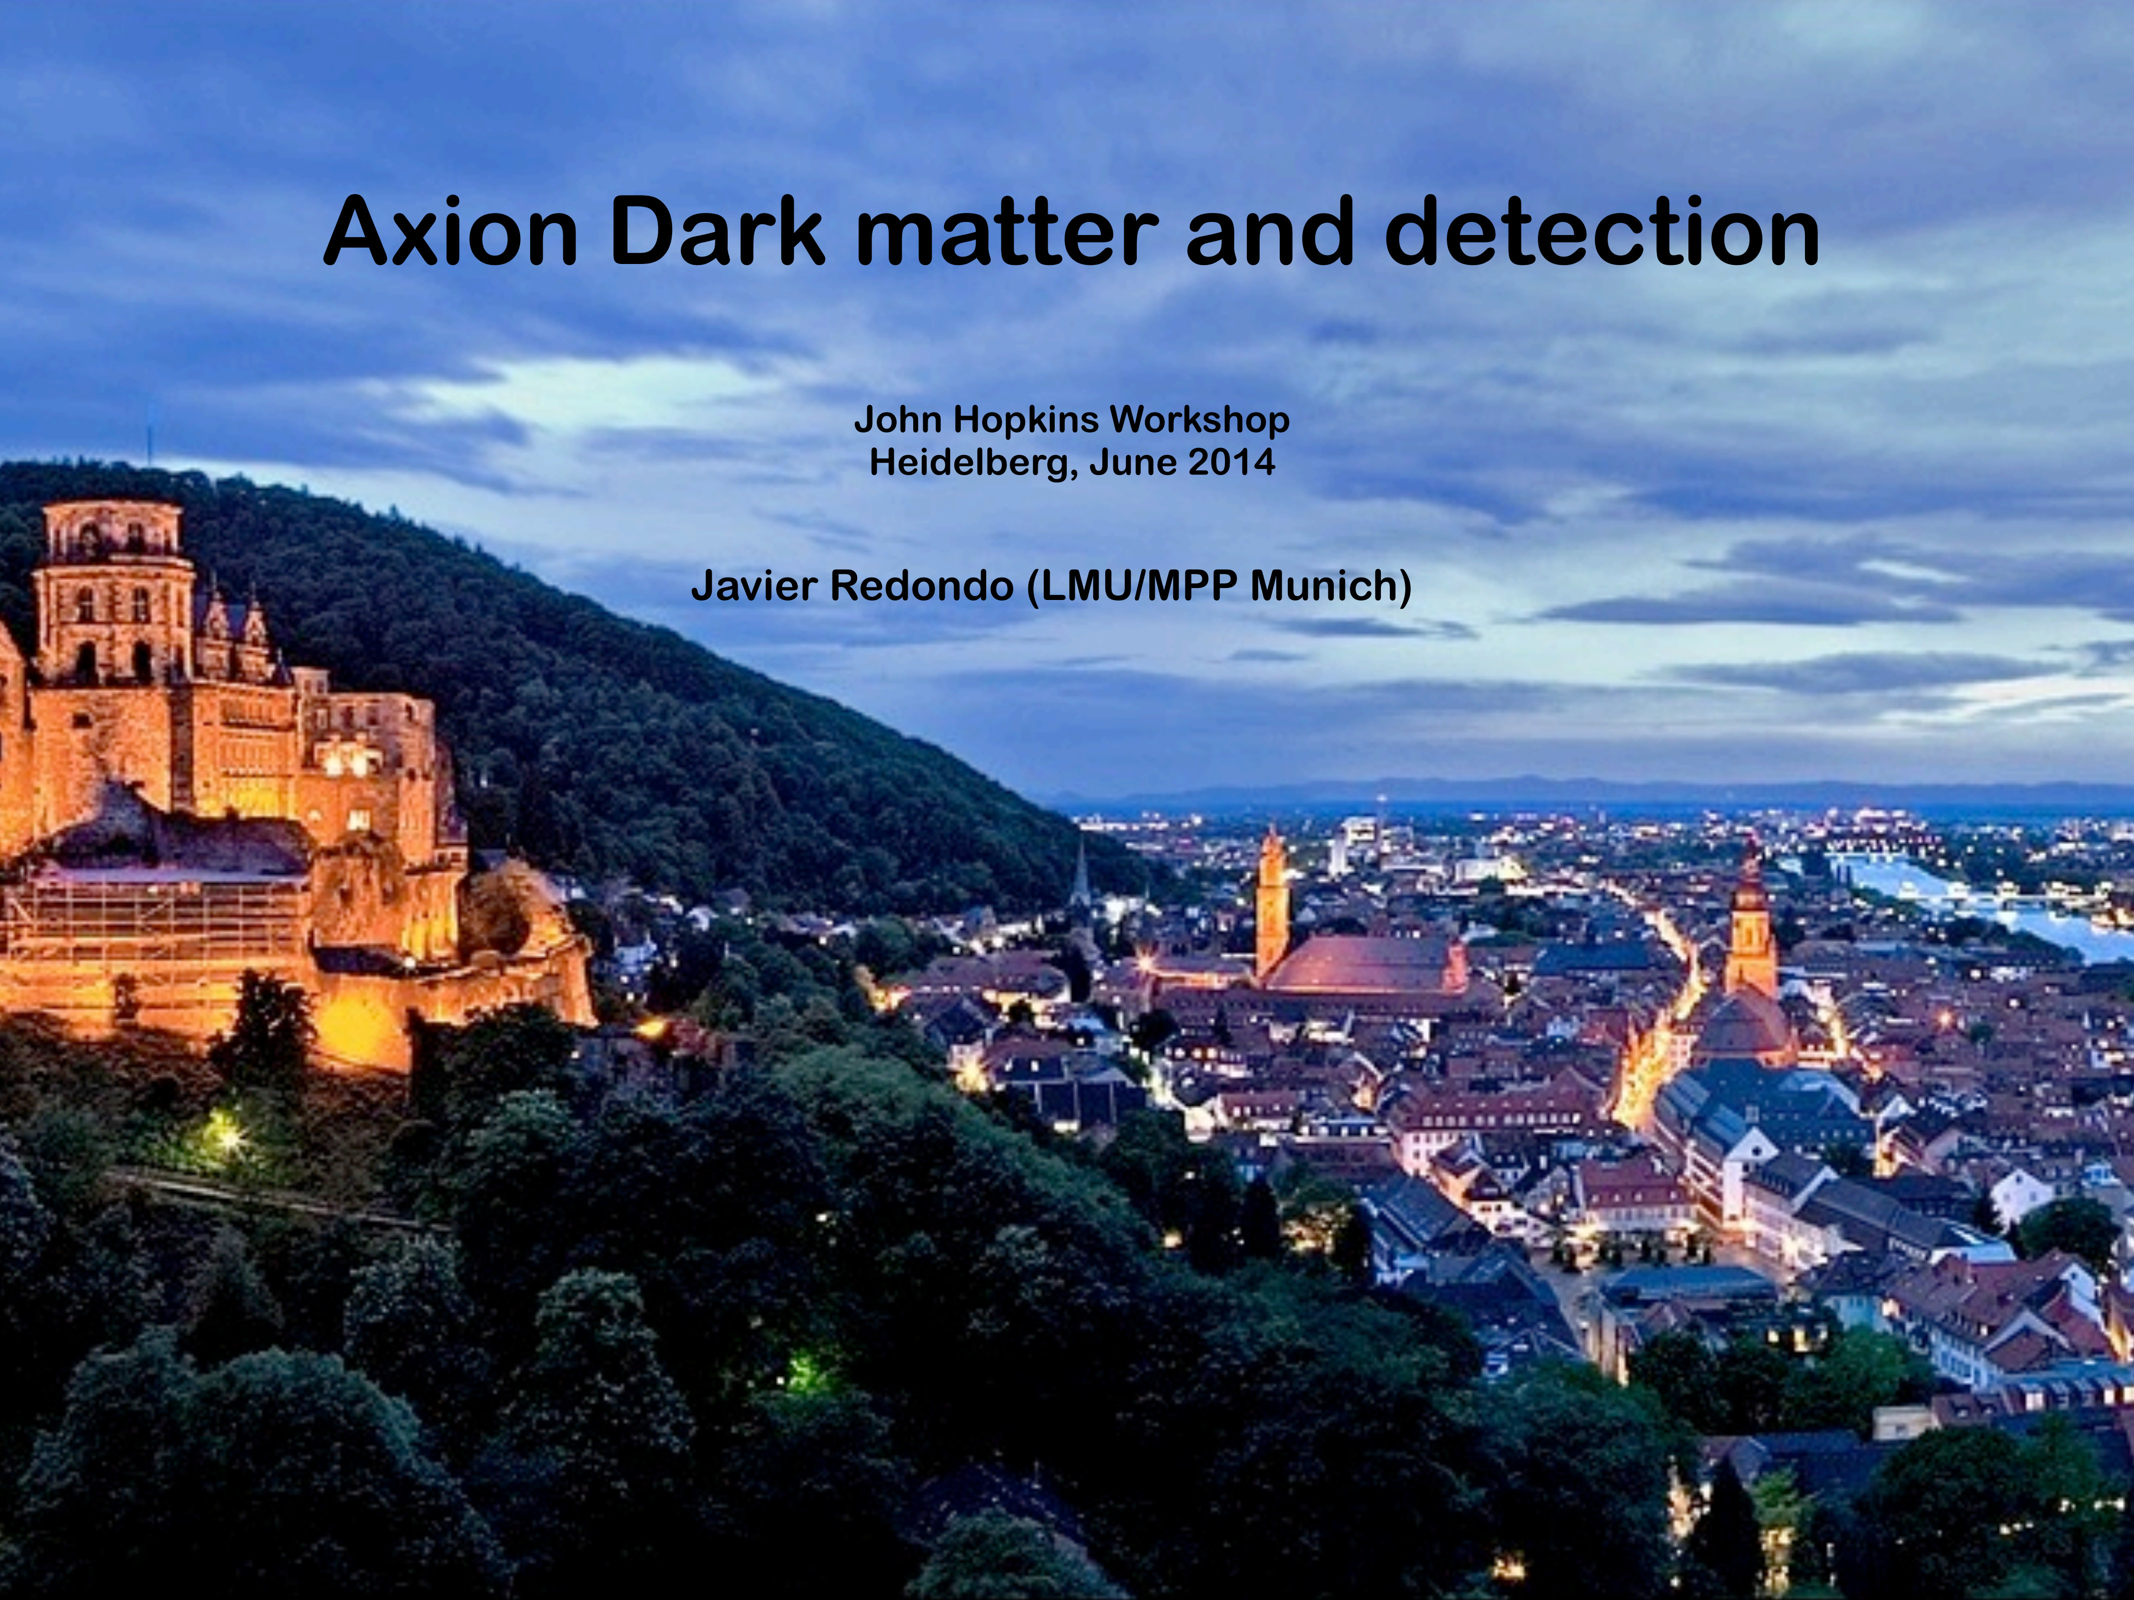
Axion Dark matter and detection

John Hopkins Workshop
Heidelberg, June 2014

Javier Redondo (LMU/MPP Munich)



outline

- Axions and strong CP

- Axion CDM

- Isocurvature problems

- Detecting Axion CDM

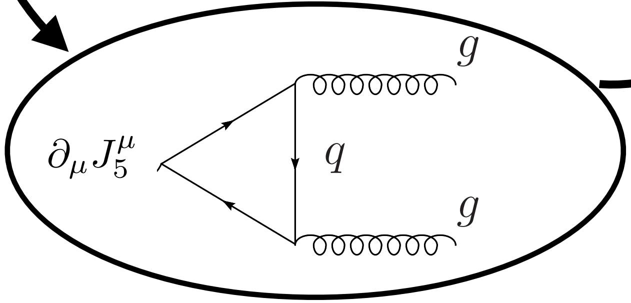
- Cavities

- Dish antenna

The strong CP “hint” and axions

- U(1)$_A$ is color anomalous, CP-violating phase $\theta = \theta_{\rm QCD} + \delta$ is physical

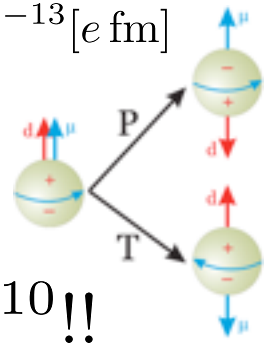
$$\mathcal{L}_{\rm SM} \in -\bar{q}_L \begin{pmatrix} m_u e^{i\delta} & 0 & \dots \\ 0 & m_d e^{i\delta} & \dots \\ 0 & 0 & \dots \end{pmatrix} \begin{pmatrix} u \\ d \\ \dots \end{pmatrix}_R - \frac{\alpha_s}{8\pi} G\widetilde{G}\,\theta_{\rm QCD}$$



Neutron EDM

$d_n \sim \theta \times \mathcal{O}(10^{-2})[e\,{\rm fm}]$

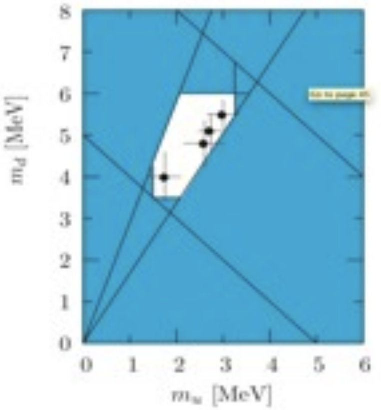
$d_n^{\rm exp} < 3 \times 10^{-13}[e\,{\rm fm}]$



$\theta < 10^{-10}$!!

- why is soooo small? is there any fundamental reason?

massless q?



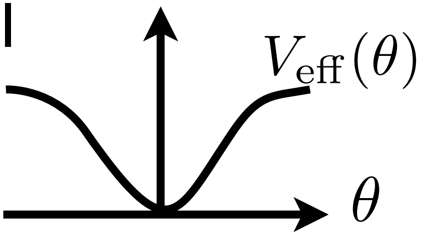
P,CP symmetries?

- (not in SM)
- set tree level
- loop problems
- still ~ok

Axion a

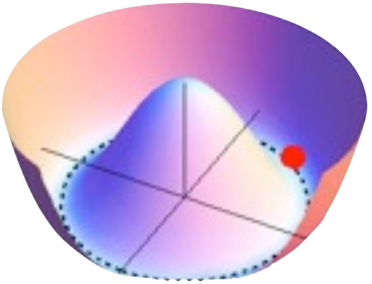
- New axial U(1) c.a. symmetry
- spontaneously broken (PGB!)
- θ promoted to field $\theta \to a/f_a$
- QCD potential

$$\theta \to 0$$



Axion mass and couplings (and model dependencies)

- Peccei-Quinn symmetry, color anomalous, spontaneously broken at f_a

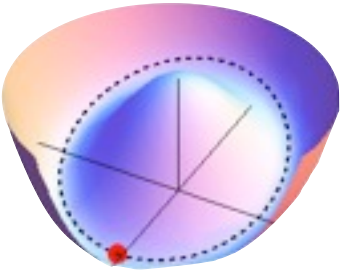


$$\mathcal{L} = \mathcal{L}_{\rm SM} + i\bar{Q}DQ - (y\bar{Q}_L Q_R \Phi + {\rm h.c}) - \lambda|\Phi|^4 + \mu^2|\Phi|^2$$

$$\Phi(x) = \rho(x) e^{i\frac{a(x)}{f_a}}$$ (KSVZ model)

- At energies below f_a $\mathcal{L} \in \frac{1}{2}(\partial a)^2 + \frac{\alpha_s}{8\pi} G\widetilde{G}\frac{a}{f_a}$

- At energies below $\Lambda_{\rm QCD}$, $a - \eta' - \pi^0 - \eta - \ldots$ mixing



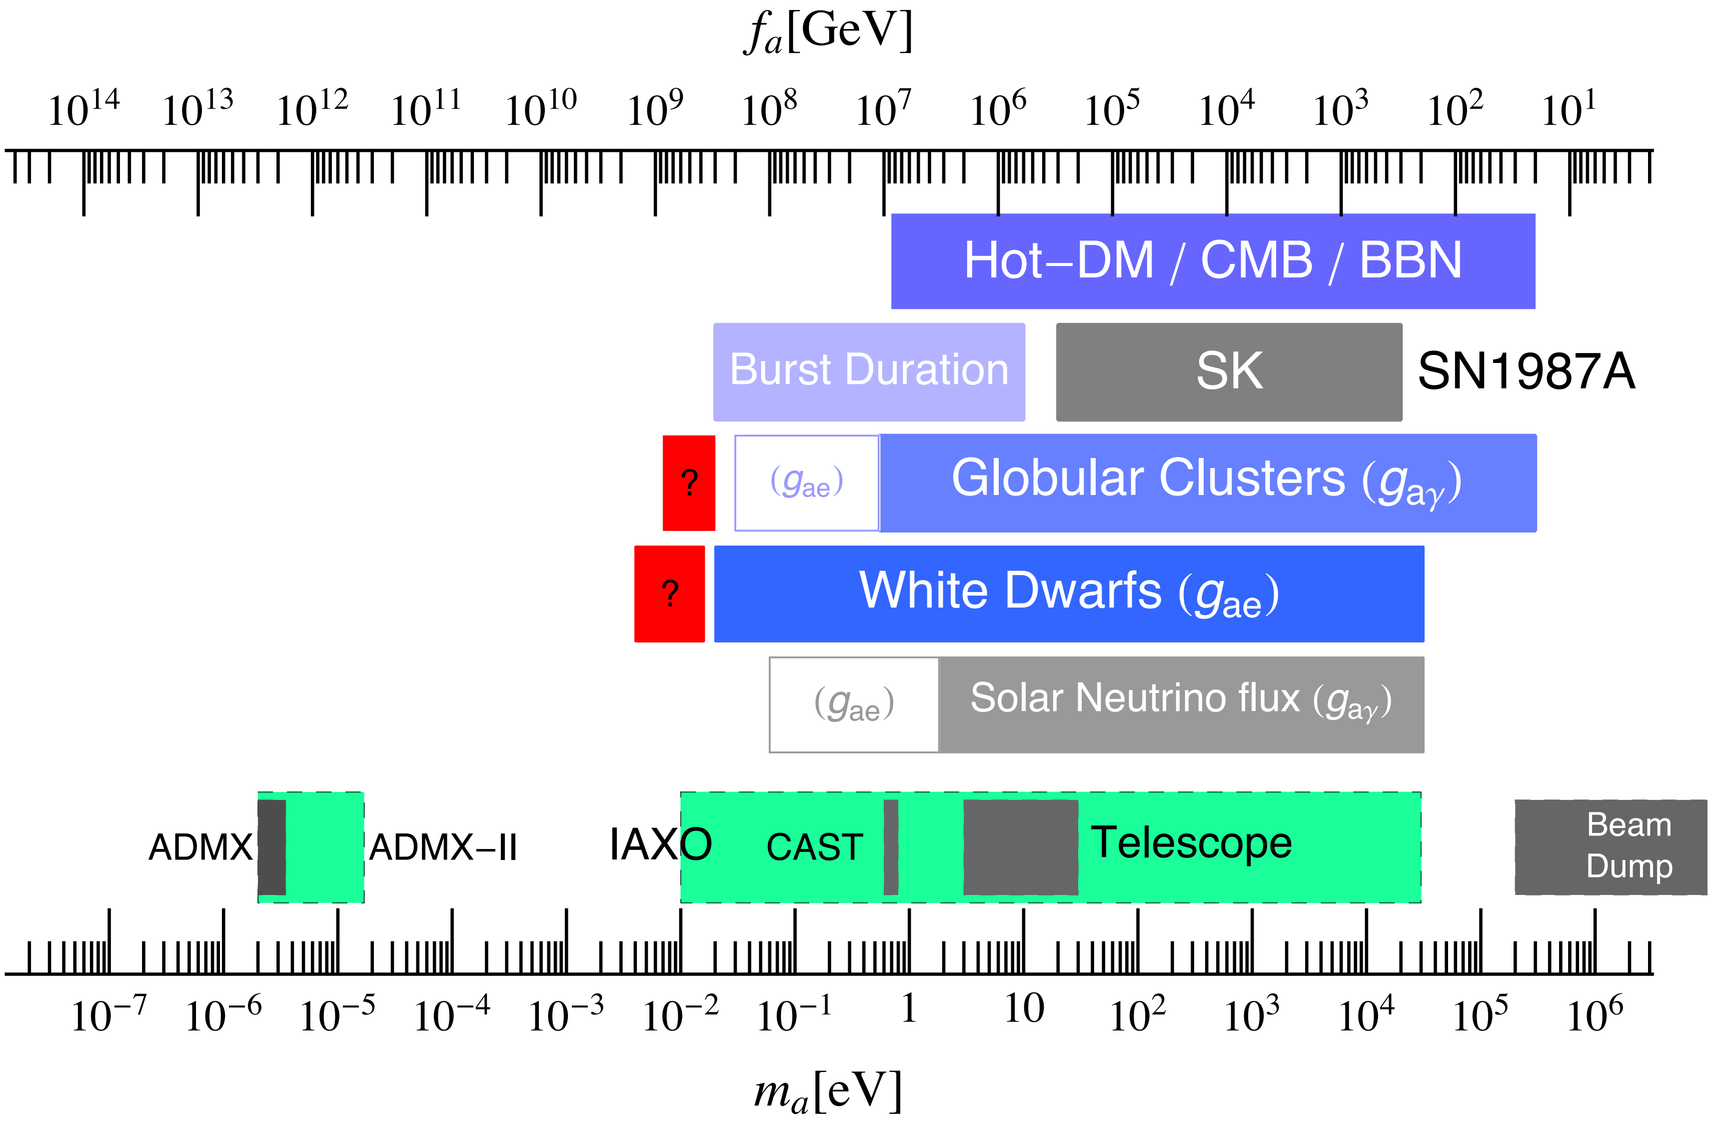
axion mass $m_a \simeq \frac{m_\pi f_\pi}{f_a} \sim 6{\rm meV}\frac{10^9{\rm GeV}}{f_a}$

axion couplings

$$\mathcal{L}_{a,I} = \sum_N c_{N,a}\bar{N}\gamma^\mu\gamma_5 N\frac{a}{f_a} + c_{a\gamma}\frac{\alpha}{2\pi}F_{\mu\nu}\widetilde{F}^{\mu\nu}\frac{a}{f_a} + \ldots$$

nucleons ... **photons ...** **mesons ...**

Parameter spaces: generic

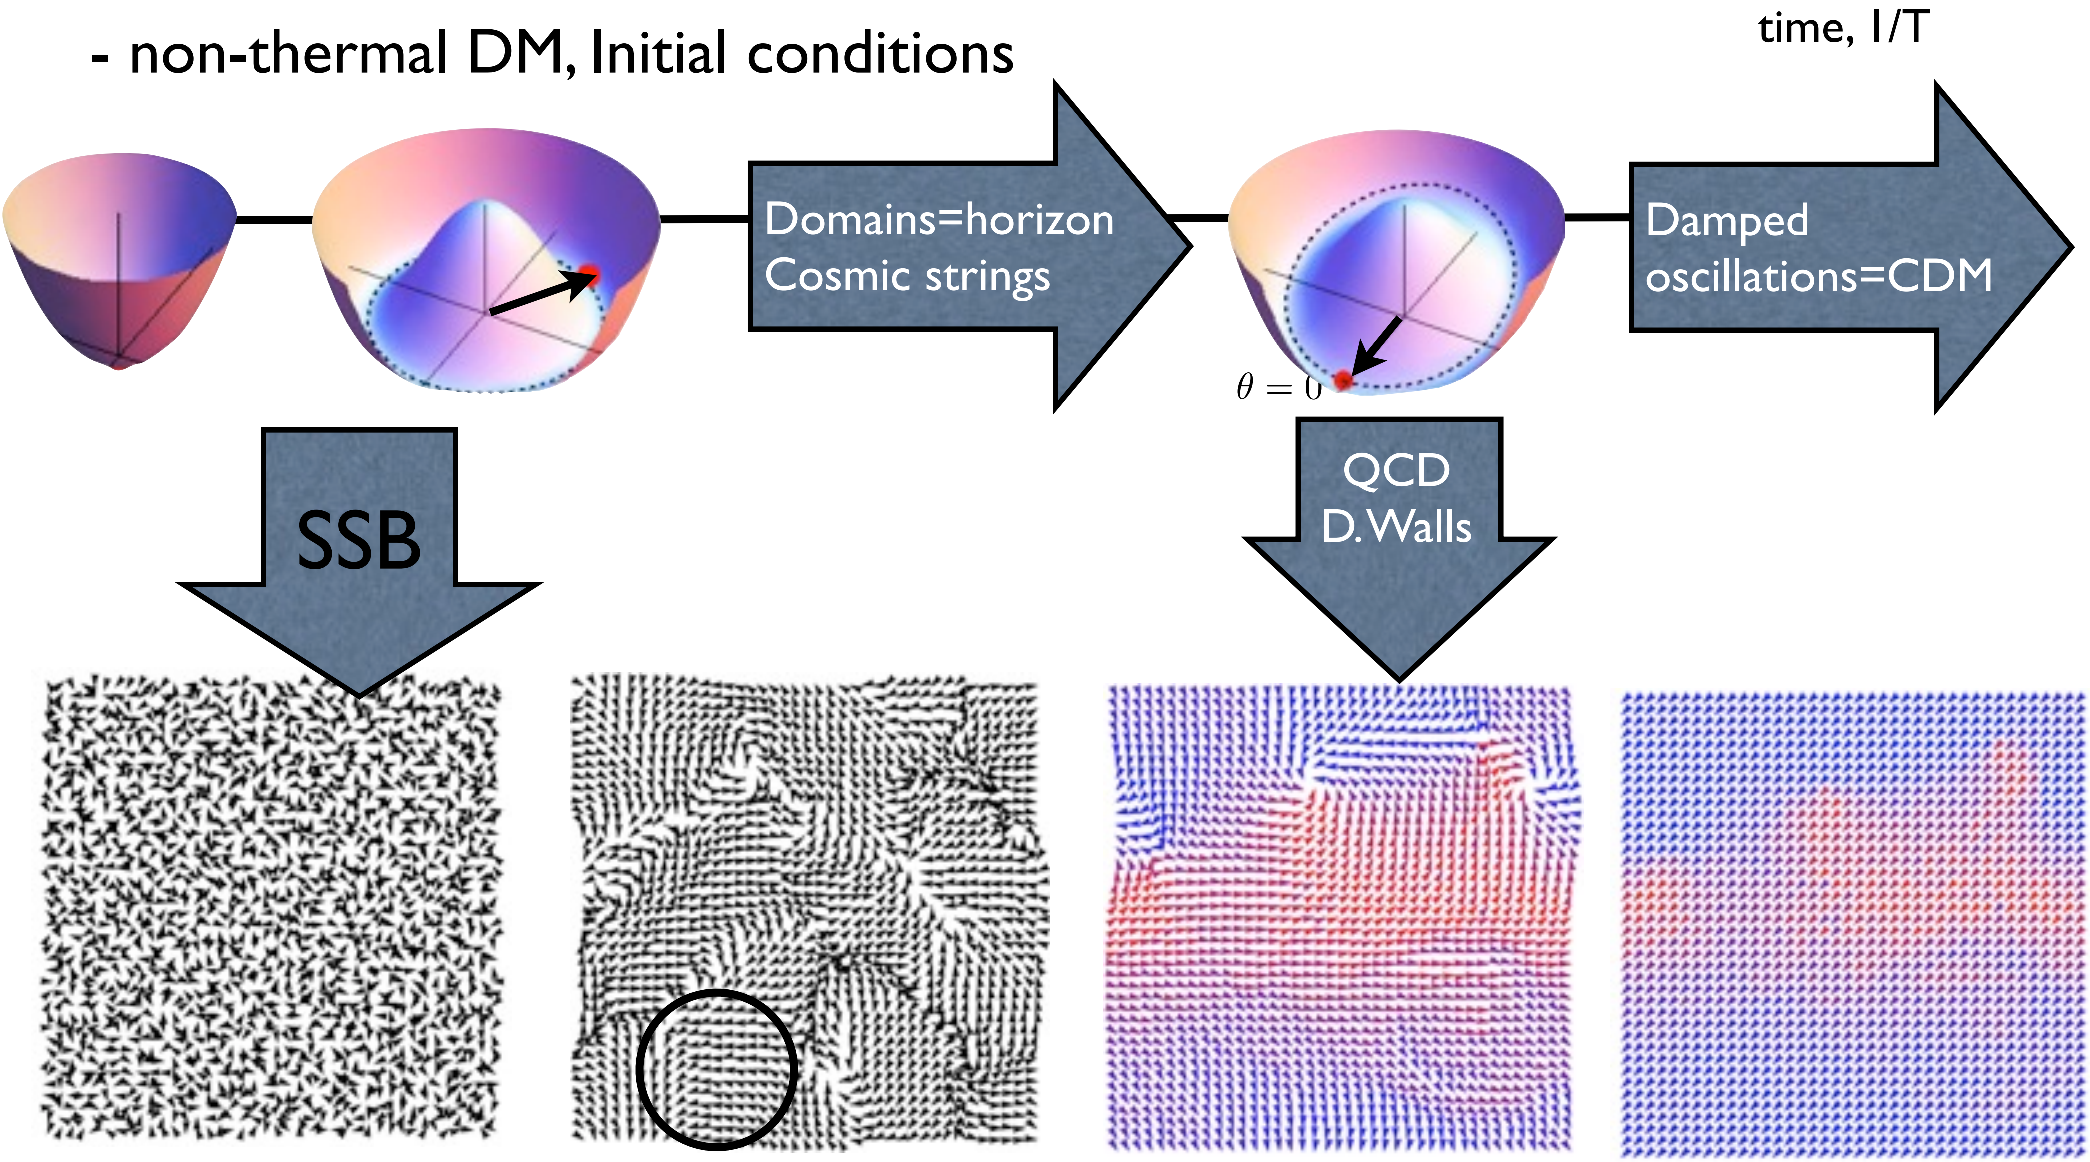


- Axions (if existing) are very light and very weakly interacting! -> WISP!

Axion cold dark matter: vacuum alignment

- Axions: small mass, small interactions, ~~thermal DM~~

- non-thermal DM, Initial conditions



time, 1/T

Domains=horizon
Cosmic strings

Damped
oscillations=CDM

SSB

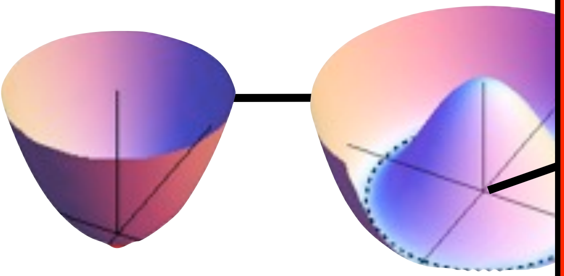
QCD
D.Walls

Axion cold dark matter: vacuum alignment

- Axions: small ma

- non-thermal DM

time, 1/T



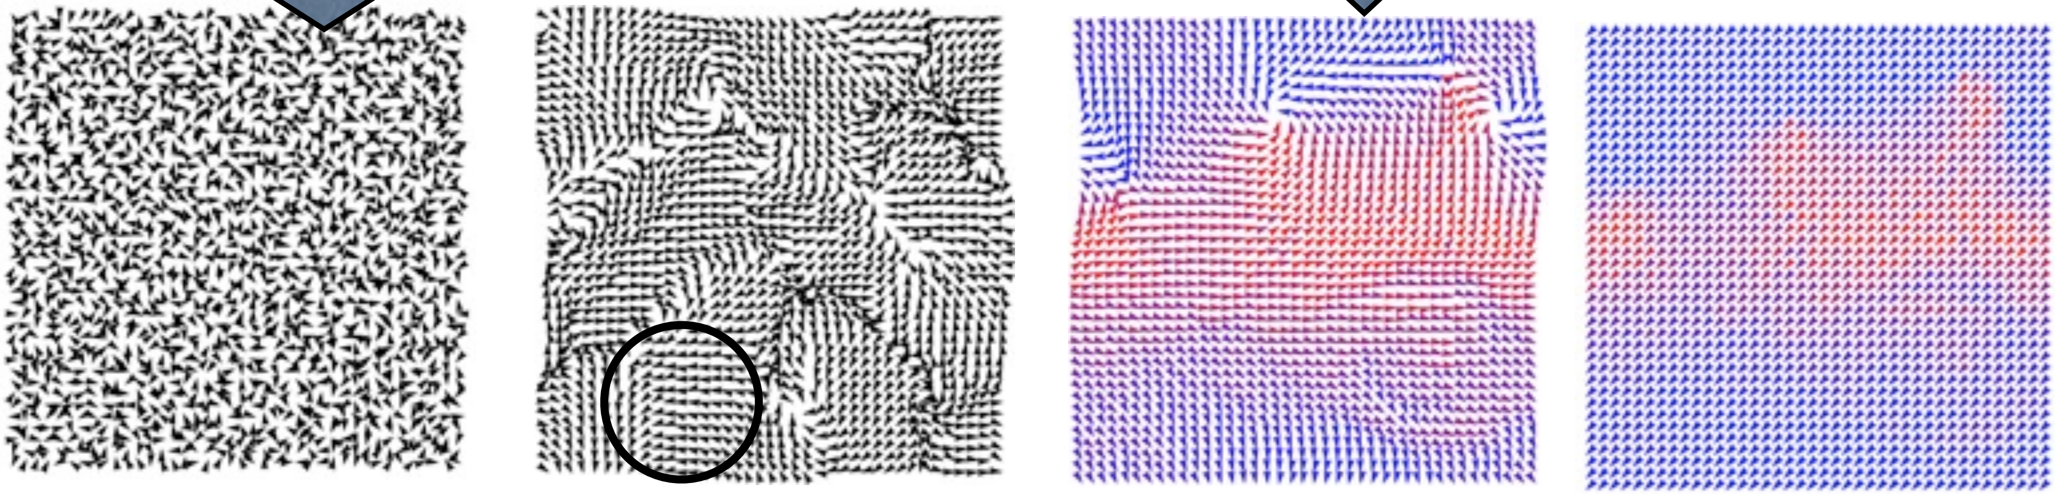
SCENARIO-I

realignment+CS+DWs

O(1) inhomogeneous DM
QCD-horizon scale
miniclusters

Damped oscillations=CDM

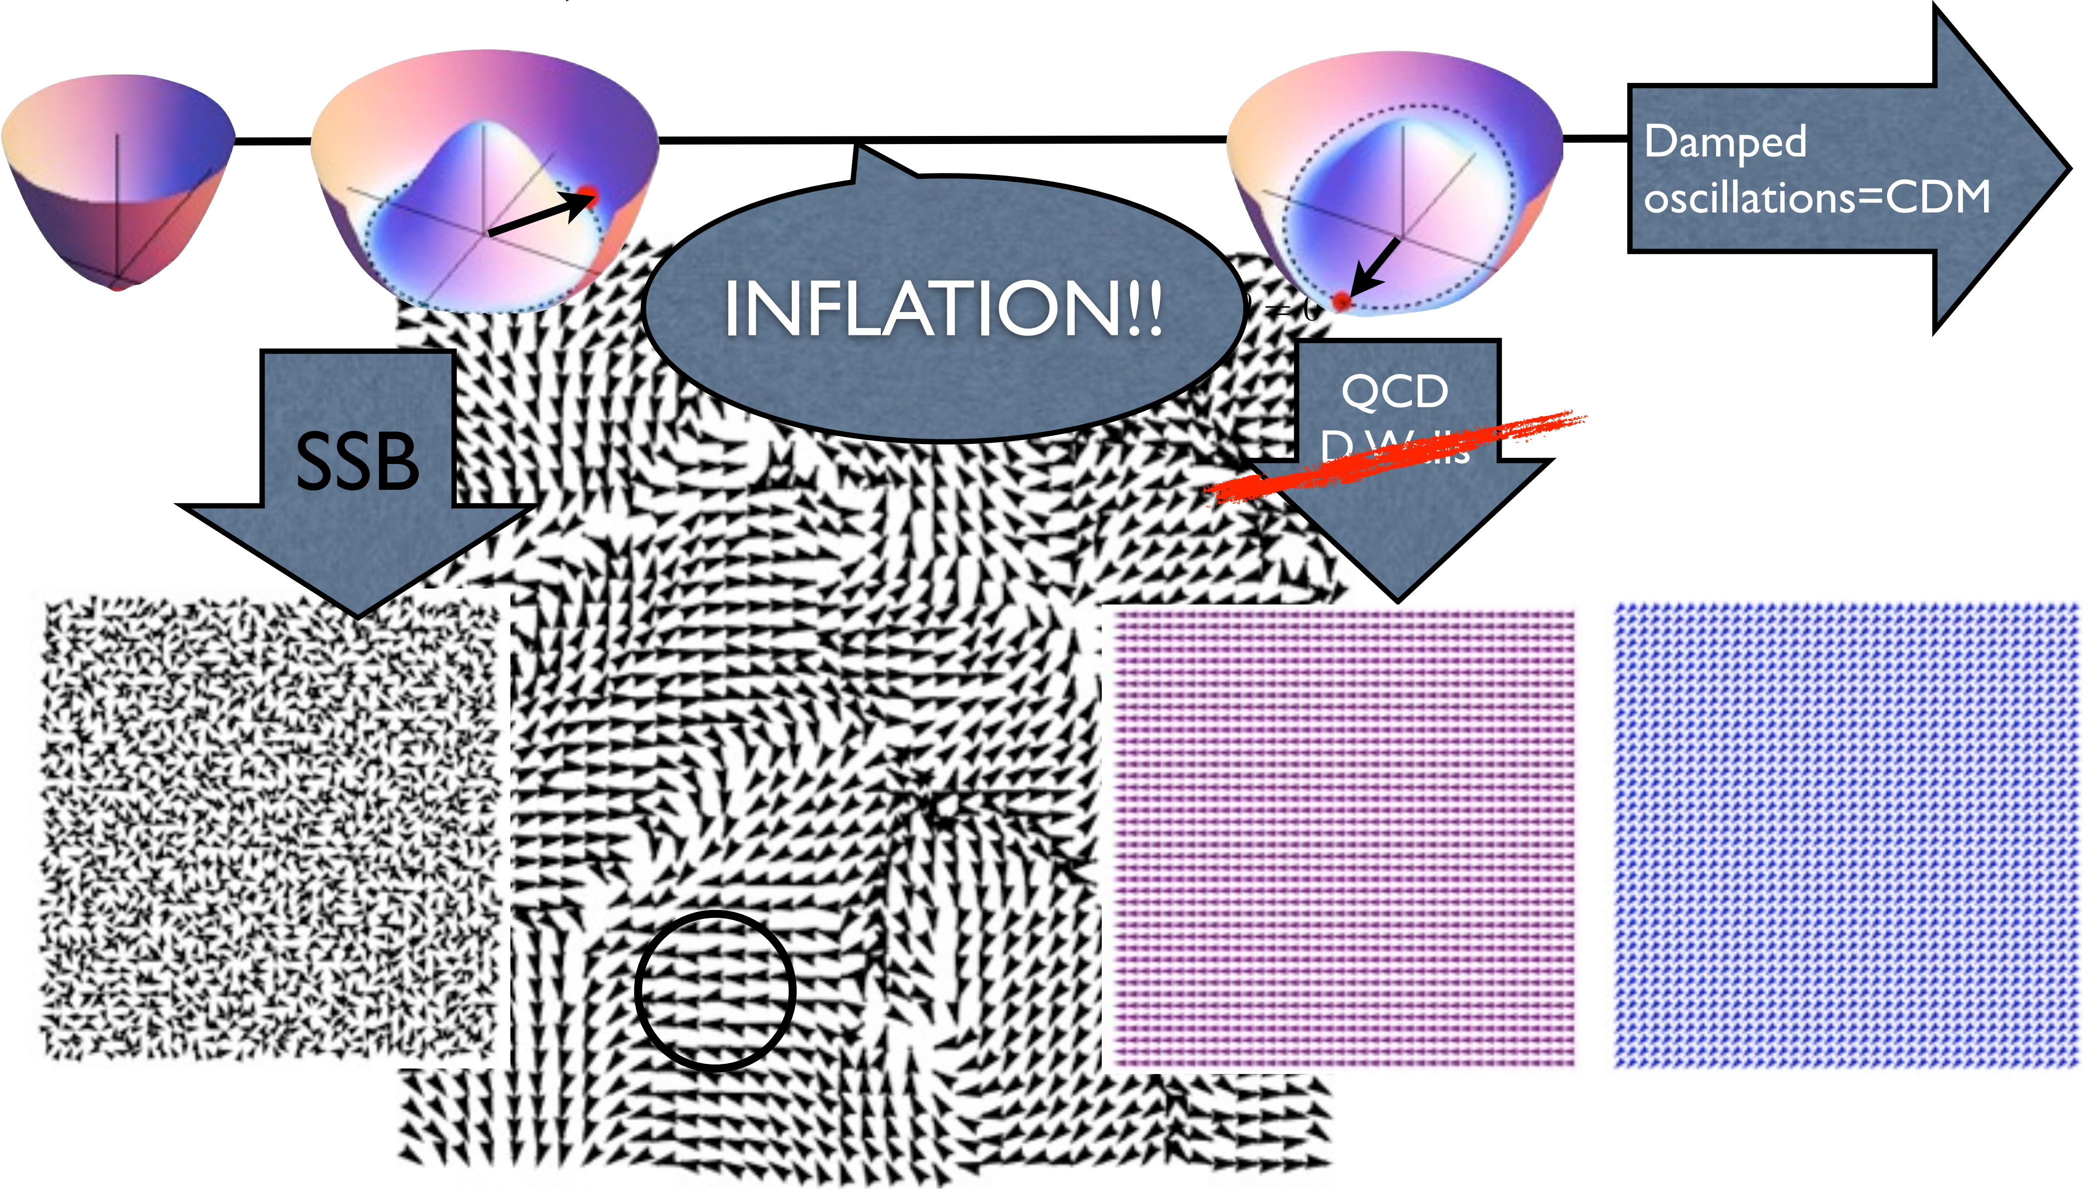
SSB



Axion cold dark matter: vacuum alignment

- Axions: small mass, small interactions, ~~thermal DM~~

- non-thermal DM, Initial conditions



time, 1/T

Damped oscillations=CDM

INFLATION!!

SSB

QCD ~~D.Walls~~

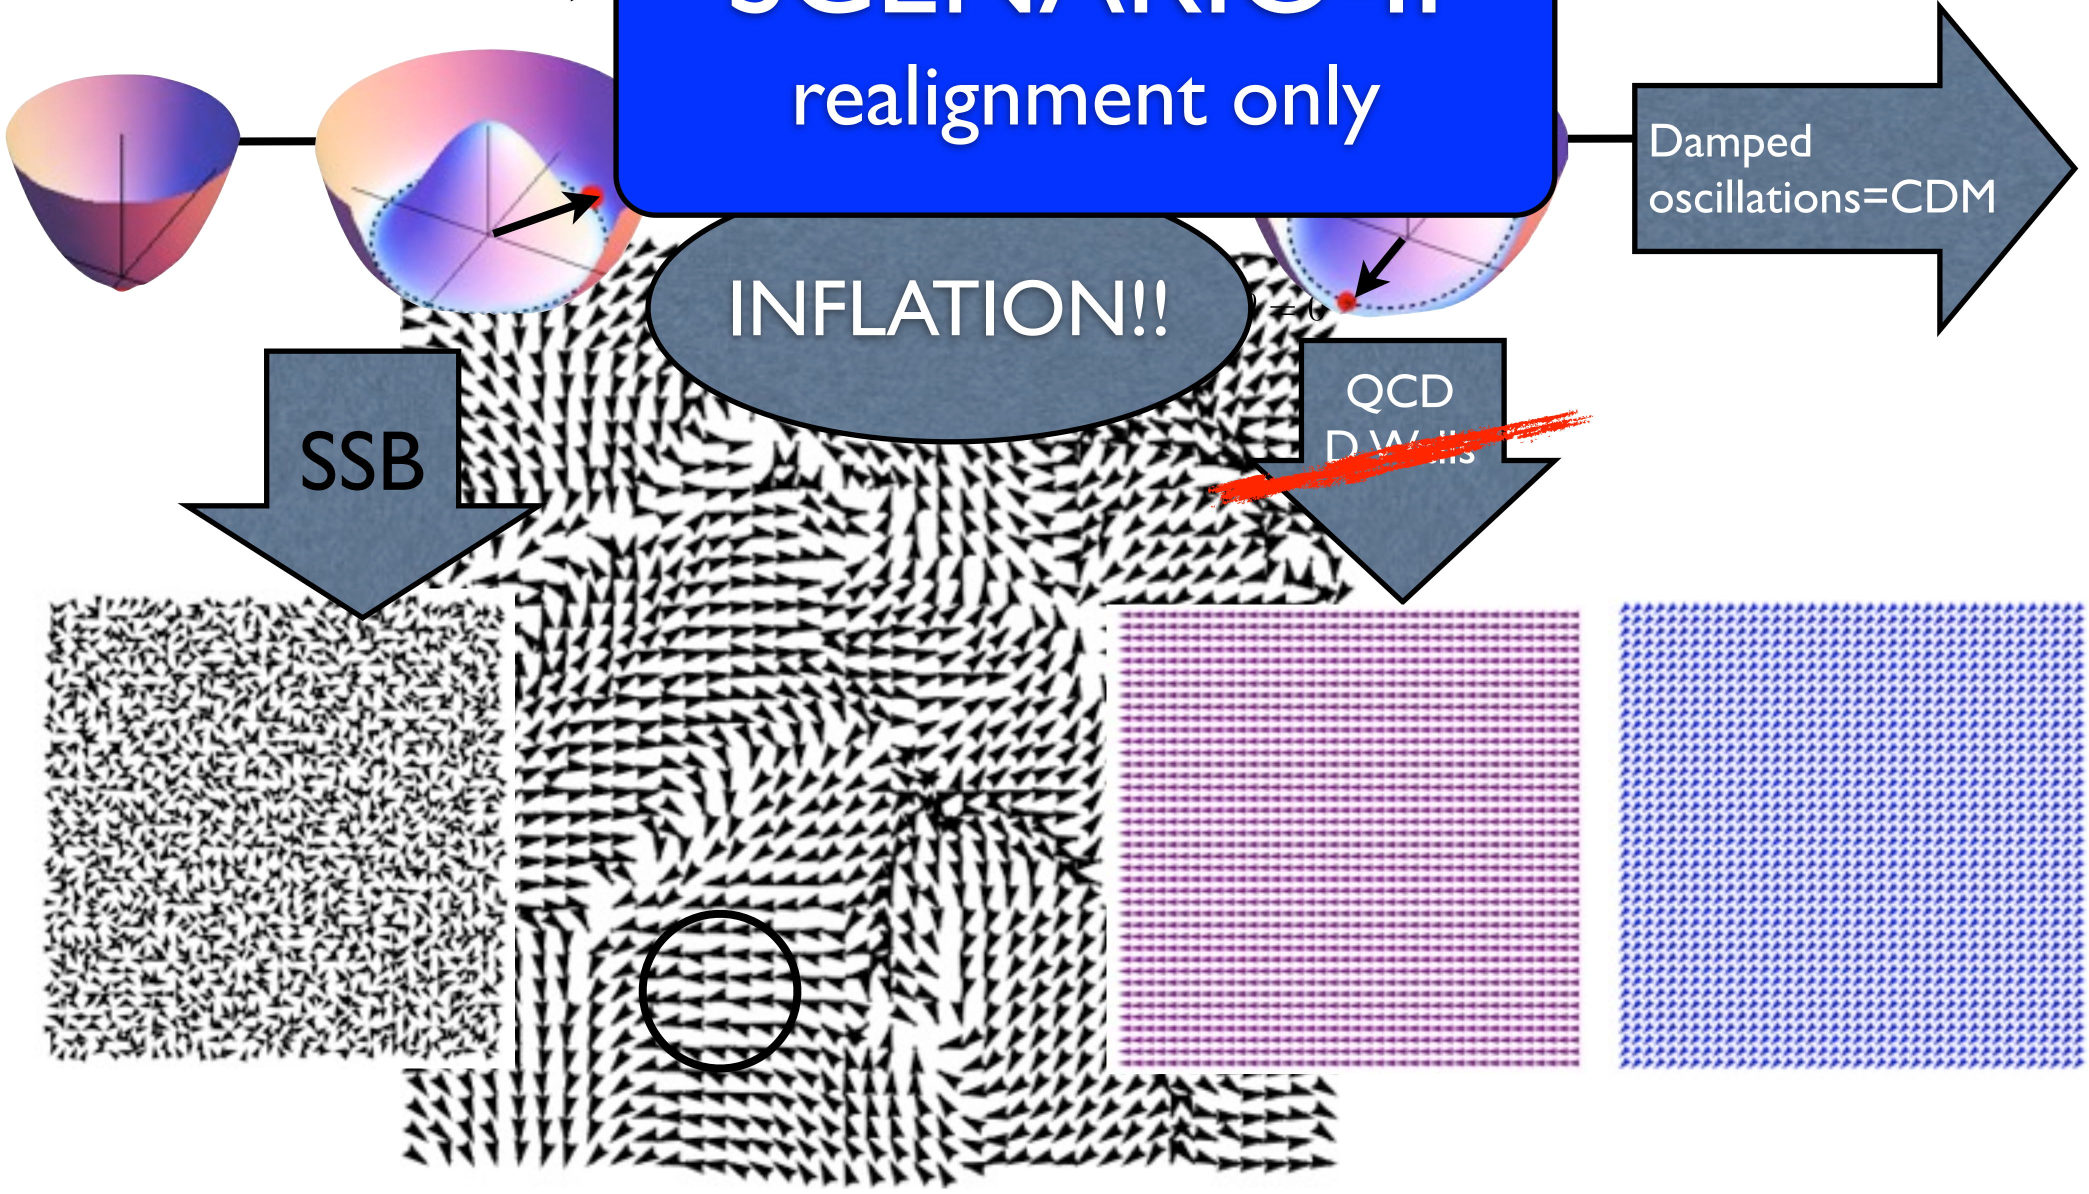
Axion cold dark matter: vacuum alignment

- Axions: small mass, small interactions ~~thermal DM~~
- non-thermal DM, I

SCENARIO-II

realignment only

time, 1/T



Rough relic abundance of axion Dark matter

- Energy density redshifts as matter, from the onset of oscillations

$$\rho_a(t) \sim \theta_I^2 \Lambda_{\rm QCD}^4 \left(\frac{R_1}{R(t)}\right)^3$$

$$\left(\frac{R_1}{R_0}\right)^3 \sim \left(\frac{T_0}{T_1}\right)^3 \sim \left(\frac{T_0}{\sqrt{H_1 m_{\rm Pl}}}\right)^3 \sim \left(\frac{T_0}{\sqrt{m_a m_{\rm Pl}}}\right)^3 \propto m_a^{-3/2}$$

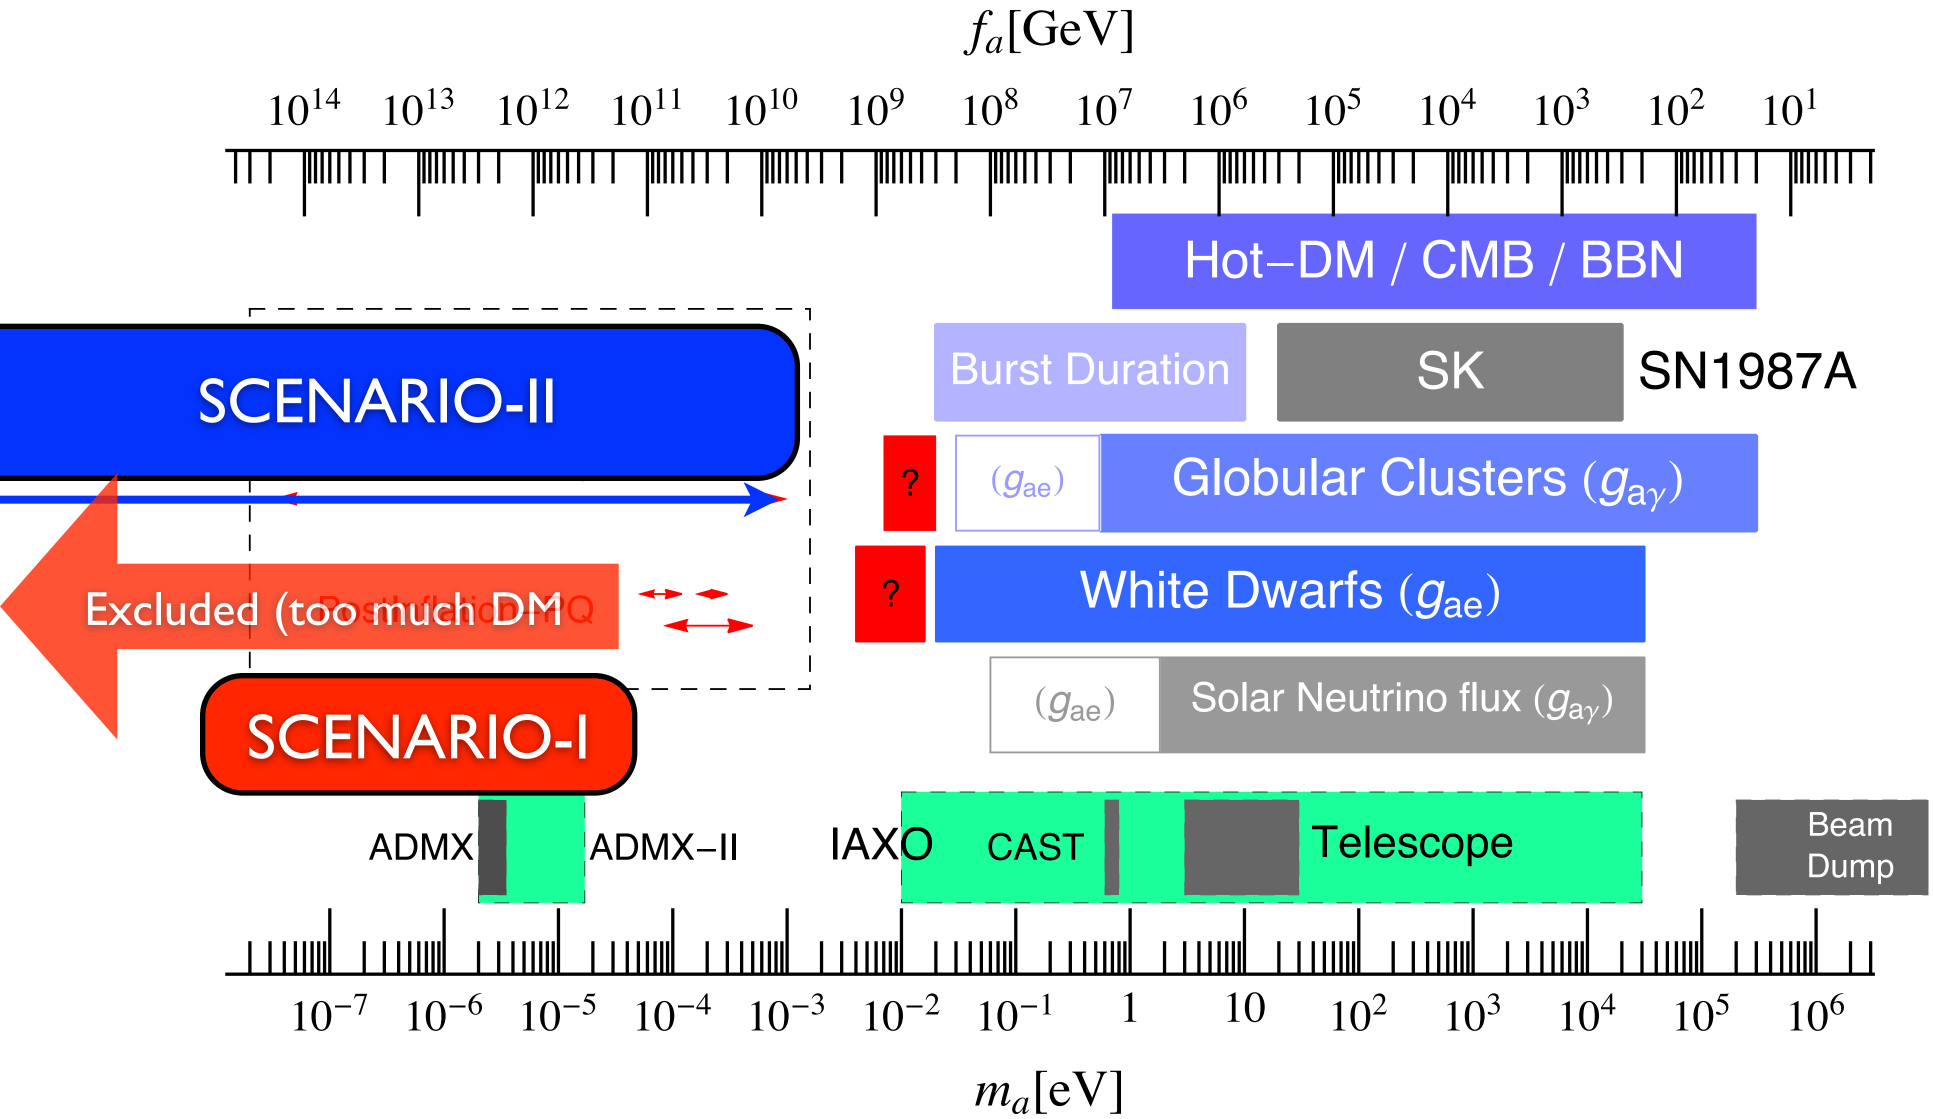
- today...

$$\boxed{\rho_a(t_0) \propto \theta_I^2 m_a^{-3/2}}$$

- doing it properly... (thermal axion mass)

$$\boxed{\rho_a(t_0) \propto \theta_I^2 m_a^{-7/6}}$$

Axion DM abundance fitting the observations



The isocurvature problem after BICEP2

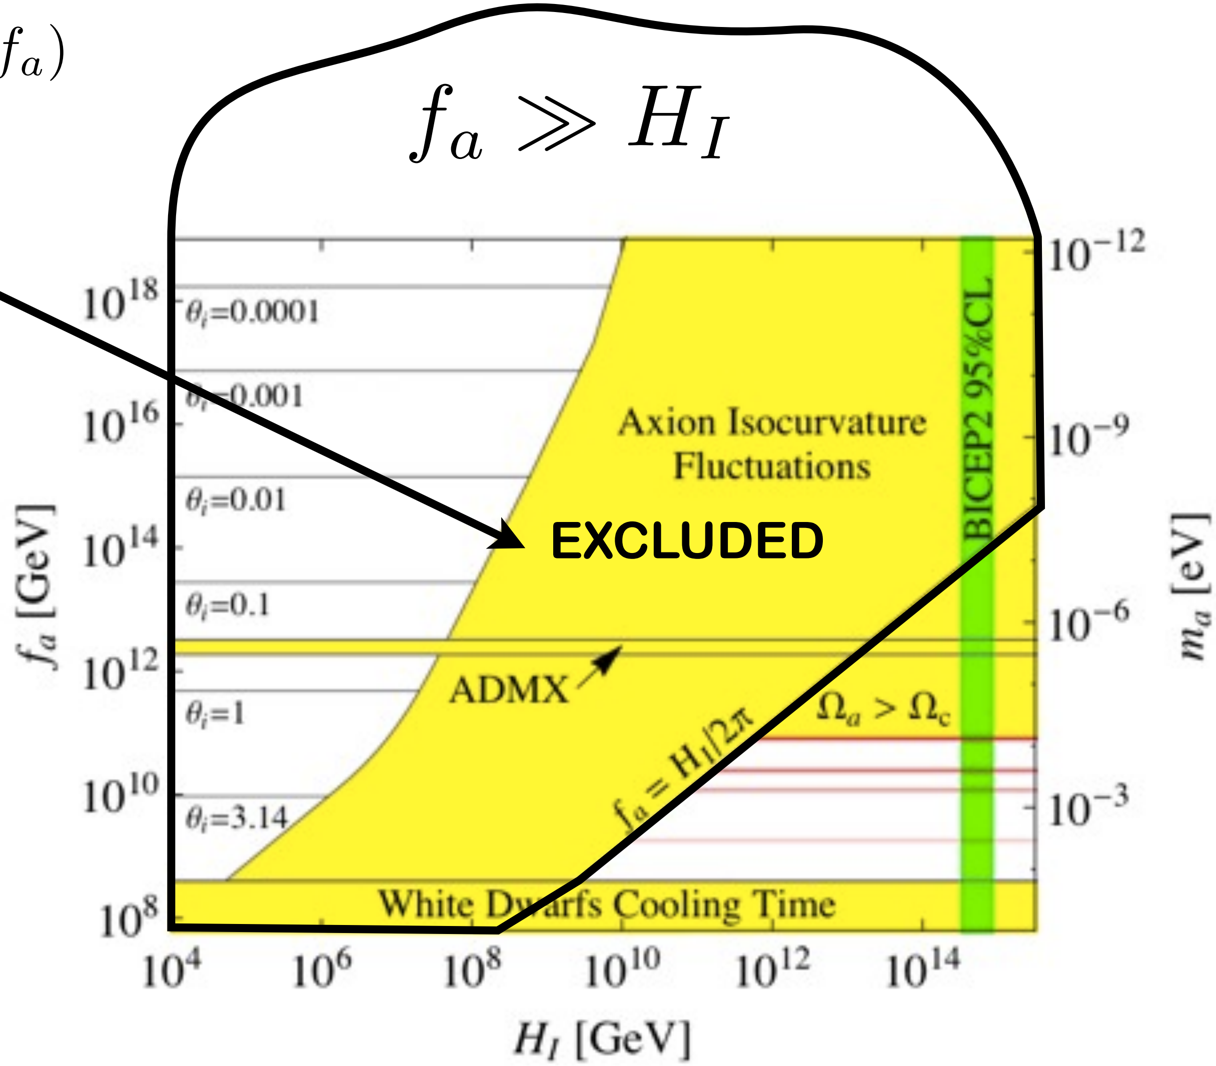
SCENARIO-II

- Axion fluctuates during inflation (entropy perturbations)

$$P_{\rm iso} = \frac{d\langle n_a\rangle}{n_a} \sim \frac{d\langle a^2\rangle}{a_I^2} = \frac{H_I^2}{\pi^2 a_I^2} = \frac{H_I^2}{\pi^2 f_a^2 \theta_I^2}$$

insisting on axion DM $\theta_I = \theta_I(f_a)$

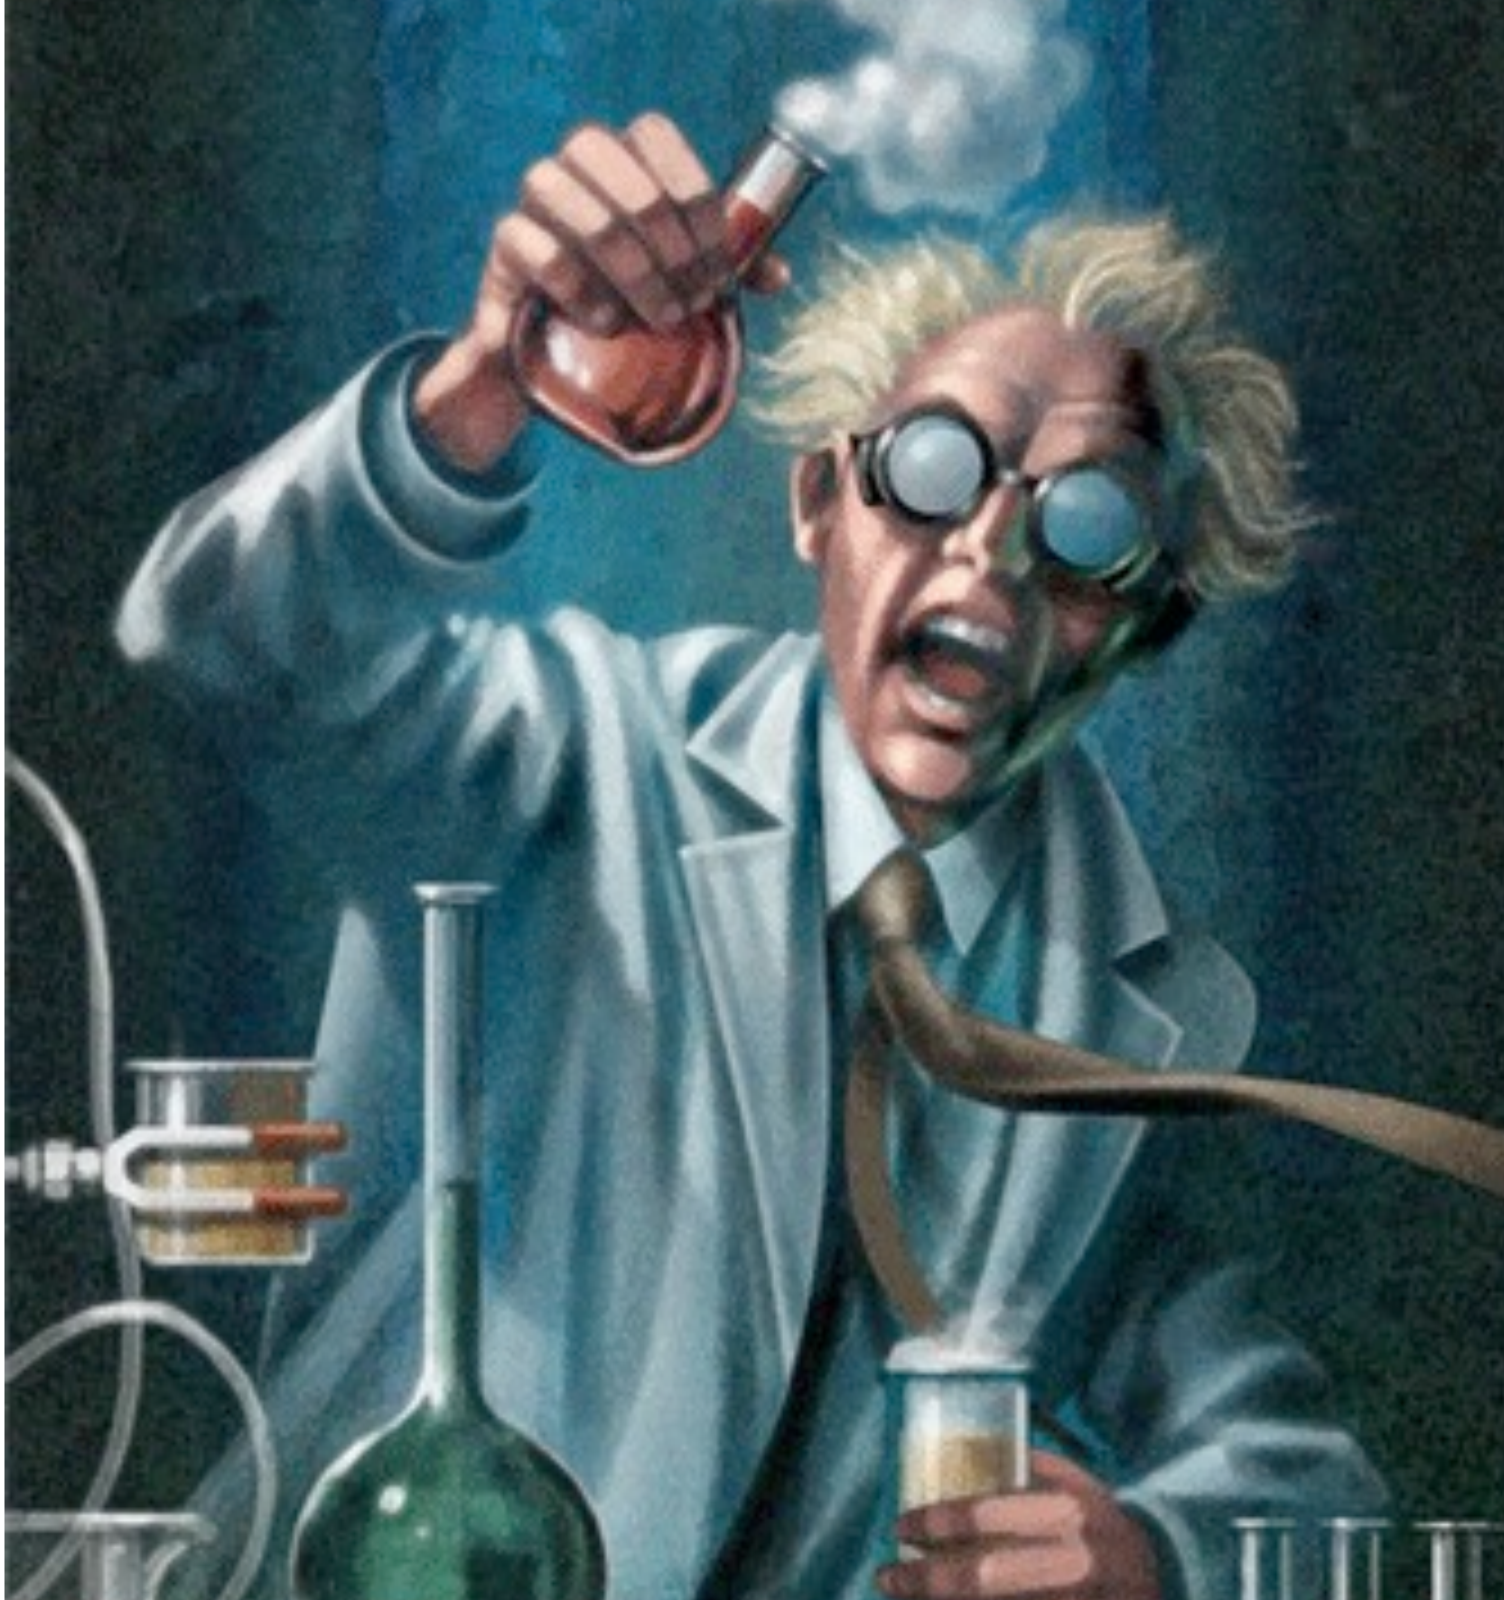
Constraint $f_a(H_I)$,



BICEP2 would exclude SC-II in the simplest models...

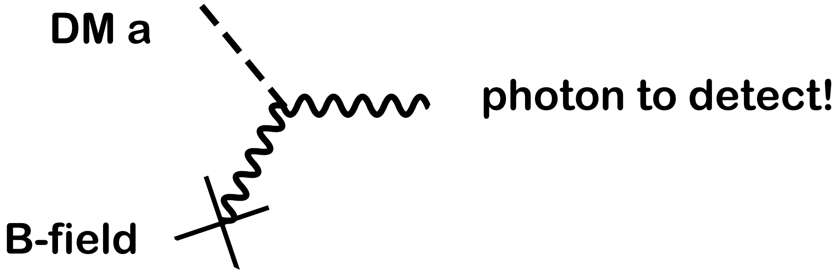
of course, there are plenty of ways out ...

Laboratory

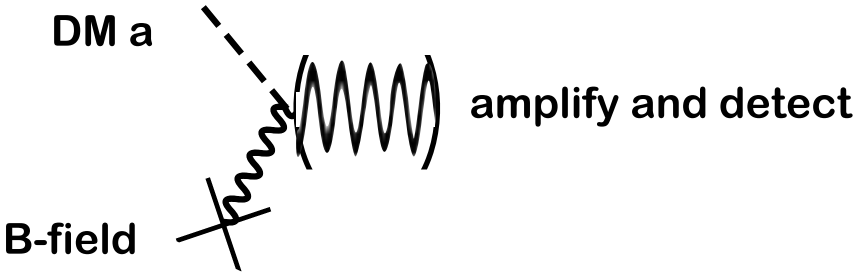


Experiments to detect axion DM

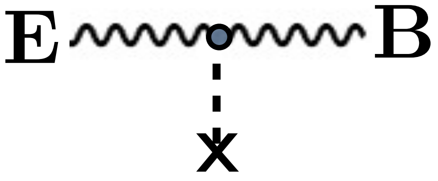
- Dish antenna



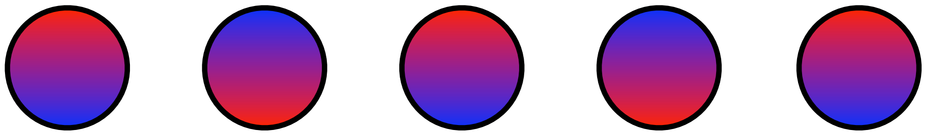
- Cavity experiments



- Light propagation



- Oscillating EDM



DM around us

$$\rho_{\rm CDM} \simeq 0.3\frac{\rm GeV}{\rm cm^3} = m_a n_a \simeq \frac{1}{2} m_a^2 f_a^2 \theta^2 \longrightarrow \theta \sim O(10^{-19})$$

velocities in the galaxy $\quad v \lesssim 300\ {\rm km/s} \sim 10^{-3} c$

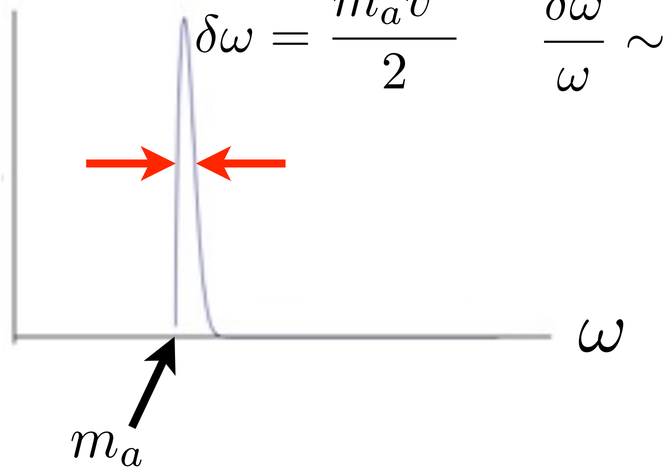
phase space density $\quad \dfrac{n_a}{\frac{4\pi p^3}{3}} \sim 10^{29} \left(\dfrac{\mu{\rm eV}}{m_a}\right)^4$

occupation number is HUGE! ⟶ still can treat it like a classical (NR) field

Roughly ... $\quad a(t) = a_0 \cos(m_a t)$

Fourier-transform $a(x)$

$$\omega \simeq m_a(1 + v^2/2 + ...)$$



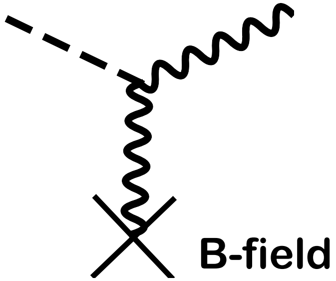
$\delta\omega = \dfrac{m_a v^2}{2} \qquad \dfrac{\delta\omega}{\omega} \sim 10^{-6}$

E-fields from axion CDM in a B-field

$$\mathcal{L}_I = -c_{a\gamma\gamma}\frac{\alpha}{2\pi}\frac{a}{f_a}\mathbf{B}\cdot\mathbf{E}$$

- In a static magnetic field, the oscillating axion field generates EM-fields

$$\mathcal{L}_I = -c_{a\gamma\gamma}\frac{\alpha}{2\pi}\theta(t)\,\mathbf{B}_{\rm ext}\cdot\mathbf{E}$$

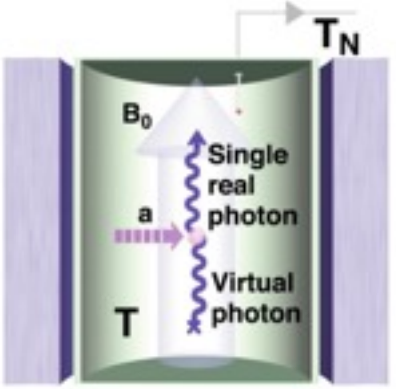


- Electric fields of order $|\mathbf{E}| \sim \mathcal{O}(10^{-12}V/m)|\mathbf{B}_{\rm ext}|\,c_\gamma\,\cos(m_a t)$

- oscillating at a frequency given by the axion mass

Do not depend on mass or coupling strength!

Detecting EM fields from Axion Dark Matter



- Haloscope (Sikivie 83)
“Amplify resonantly the EM fields created by axionDM in a B-field in a cavity”

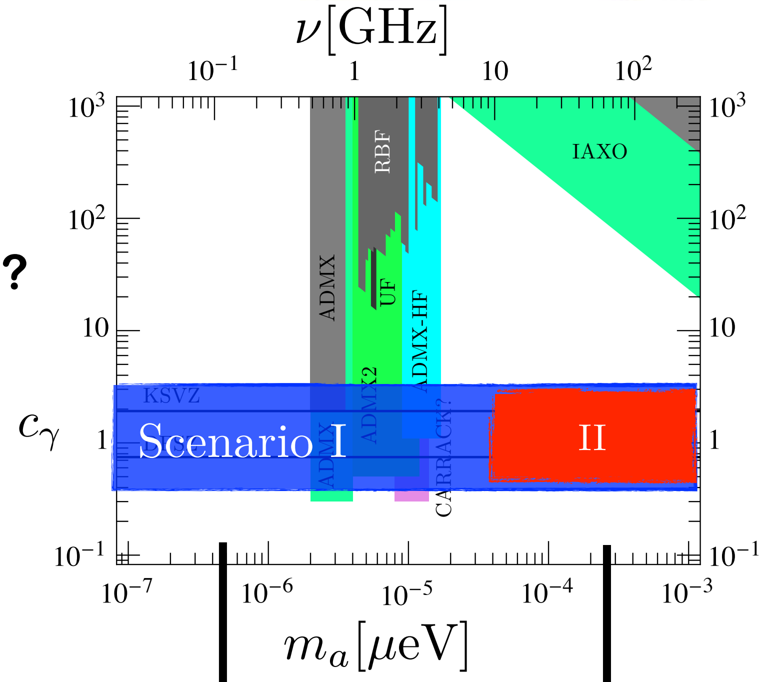
$$P \sim Q|\mathbf{E}_a|^2(Vm_a)\mathcal{G}\kappa \qquad \text{(on resonance)}$$

- Past experiments Florida U., RBF, ADMX, CARRACK
- Future endeavors: ADMX, ADMX-HF, YMCE, CAPP

- Parameters unexplored at low and high masses: WHY?

Cylindrical cavity $(h/r{=}b)$ **like ADMX but scaled**

- Signal $\quad (V \propto m_a^{-3}) \quad P_{\rm out} \propto V m_a \sim \dfrac{1}{m_a^2}$
- Noise $\quad P_{\rm noise} = T_{\rm sys}\Delta\nu_a \propto m_a^2$
- Signal/noise in $\Delta\nu_a$ of time, t, $\quad \dfrac{S}{N} = \dfrac{P_{\rm out}}{P_{\rm noise}}\sqrt{\Delta\nu_a t}$
- Scanning rate $\quad \dfrac{1}{m_a}\dfrac{d\Delta m_a}{dt} \propto \dfrac{c_\gamma^4}{m_a^9}$

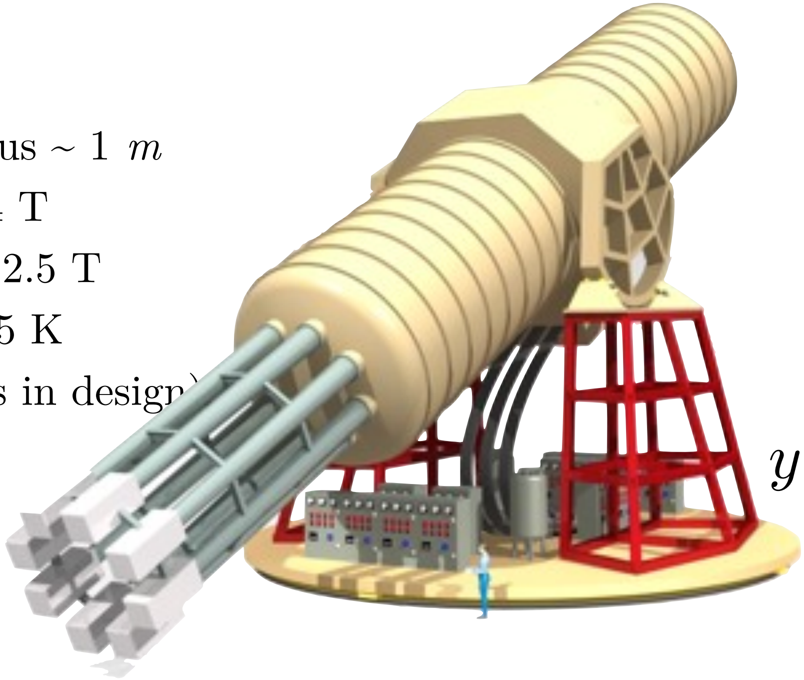


Very easy, but needs large magnet volume!

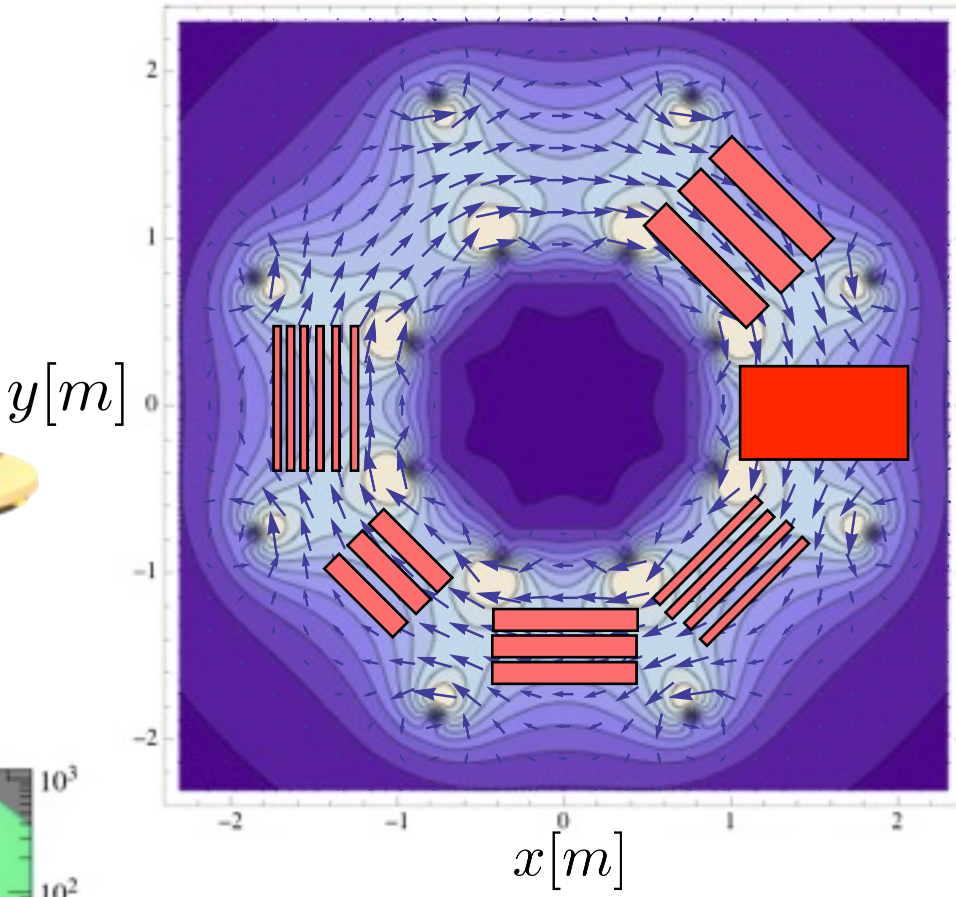
Very complicated, needs new ideas...

DM searches with future IAXO (International Axion Observatory)

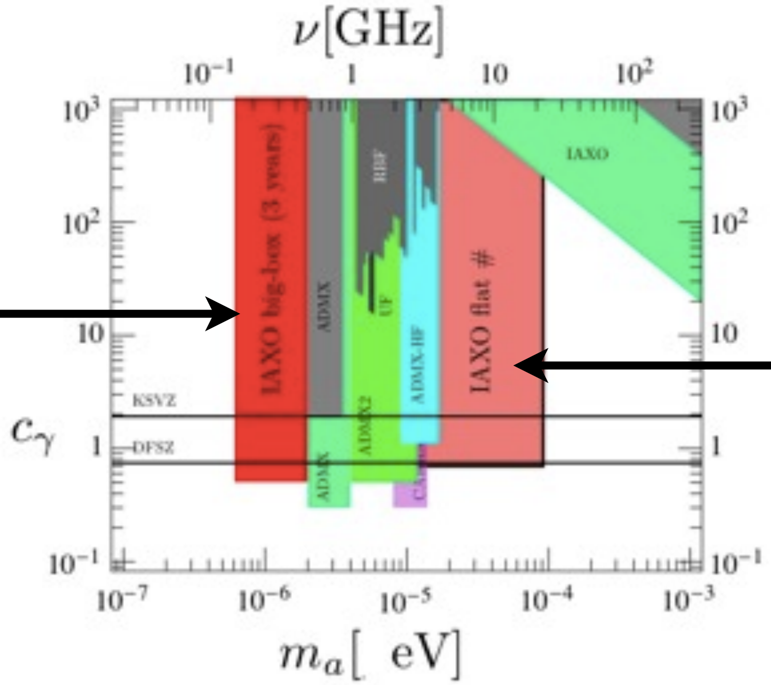
- Length = 20 m
- Magnetised radius ~ 1 m
- Peak value ~ 5.4 T
- Average in bore 2.5 T
- Available T ~ 4.5 K
  (but warm bores in design)



field map of transverse cut



- Sensitivity



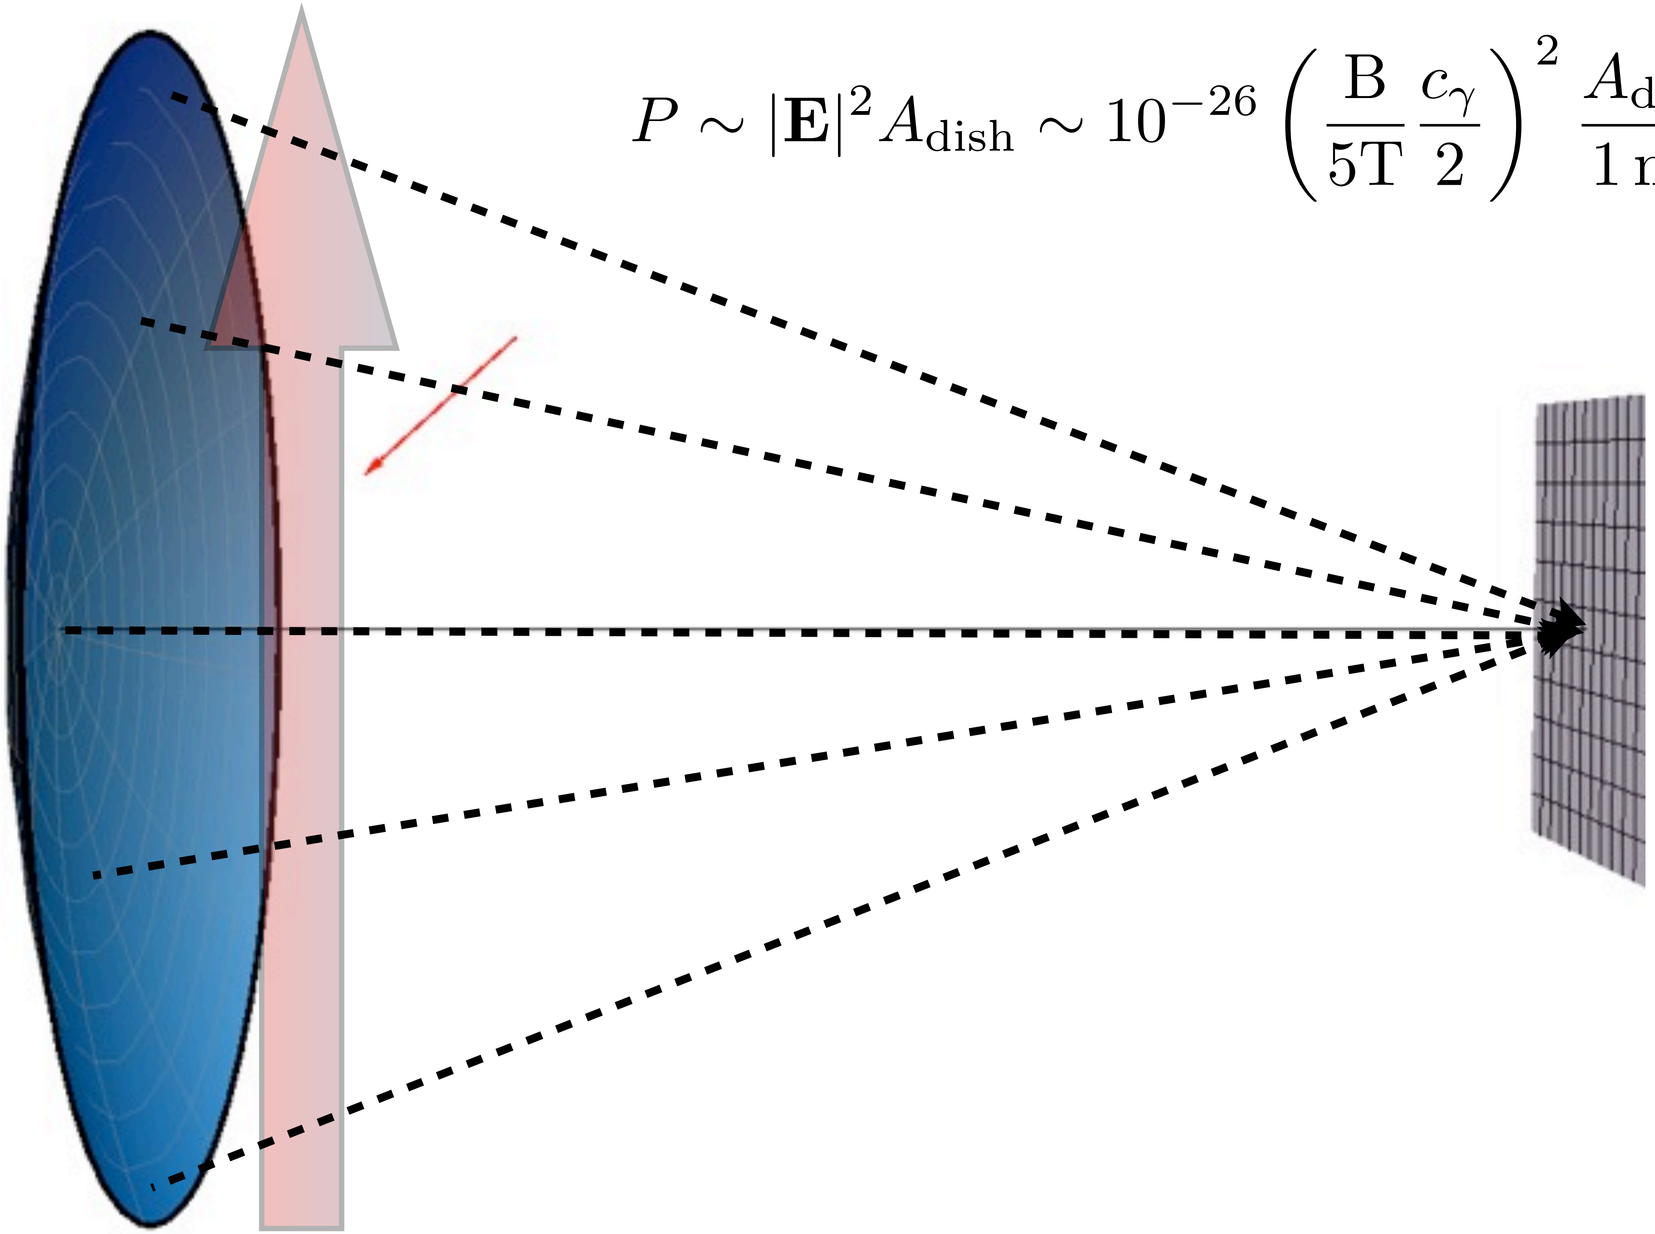
Big cavity
(realistic)

Many flat (exploit the huge volume)
(very speculative, R&D needed!)

Simplest experiment: Dish antenna

Horns at al JCAP04(2013)016

$$P \sim |\mathbf{E}|^2 A_{\rm dish} \sim 10^{-26} \left(\frac{\rm B}{\rm 5T}\frac{c_\gamma}{2}\right)^2 \frac{A_{\rm dish}}{1\,{\rm m}^2}{\rm Watt}$$

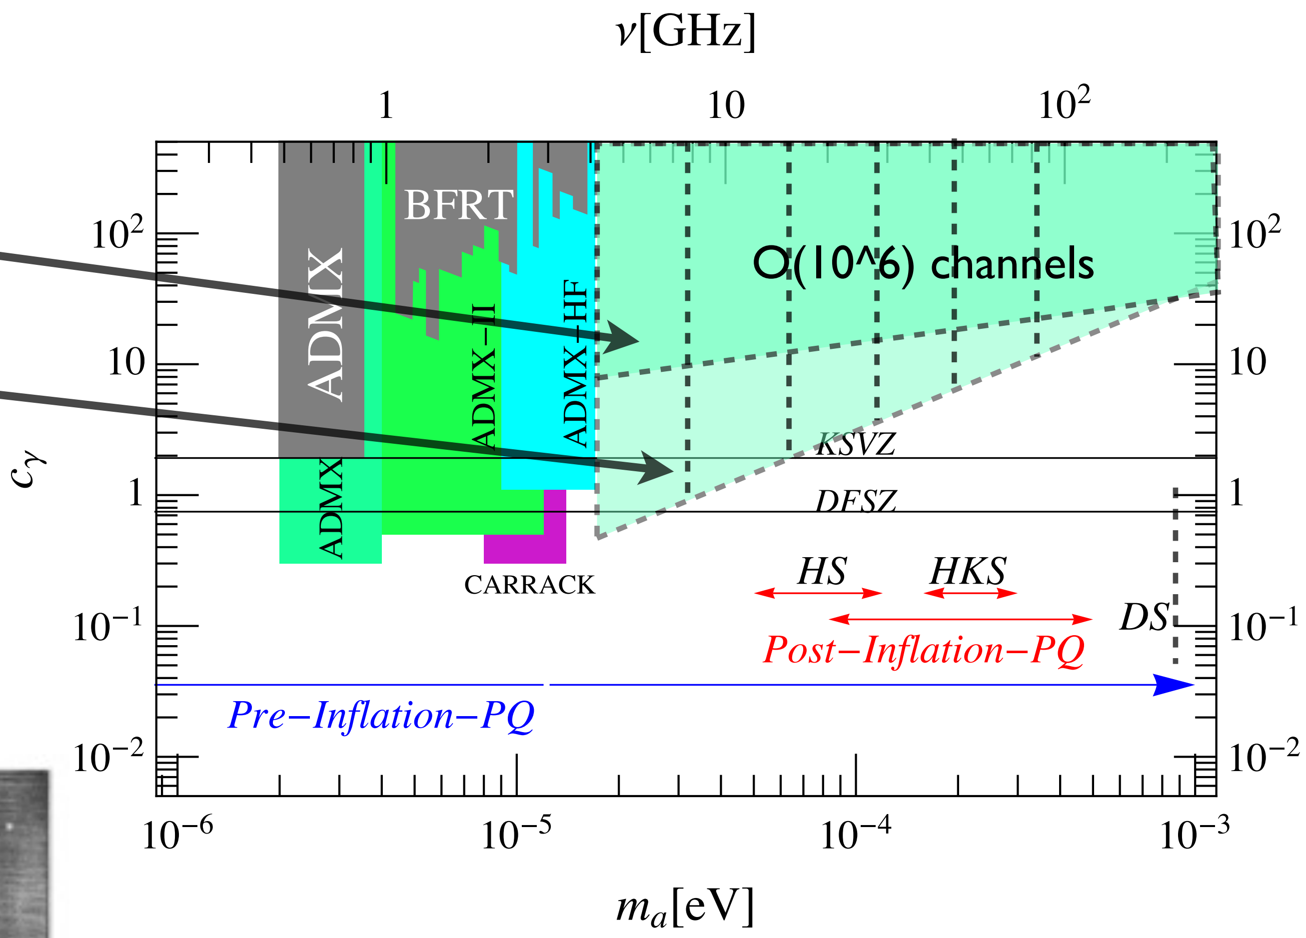


spherical reflecting dish

Simplest experiment: Dish antenna

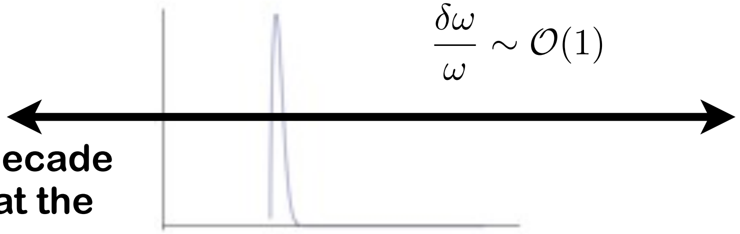
A=10m2,T=5K, B=5T, t=1year,

A=10m2, T=QL, B=10T, t=1year,



$$\rho_{\rm CDM} \sim \frac{0.3\,\rm GeV}{\rm cm^3}$$

broadband! ☺

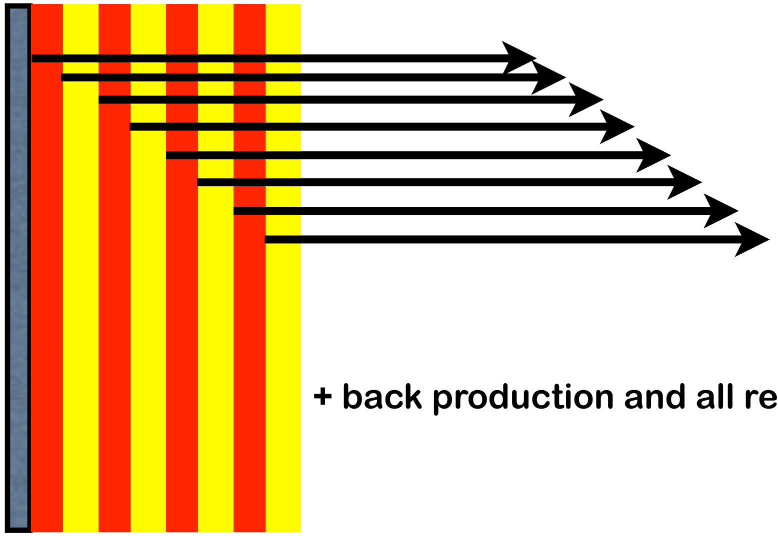


$$\frac{\delta\omega}{\omega} \sim \mathcal{O}(1)$$

measure 1/octave of a decade with the same detector at the same time

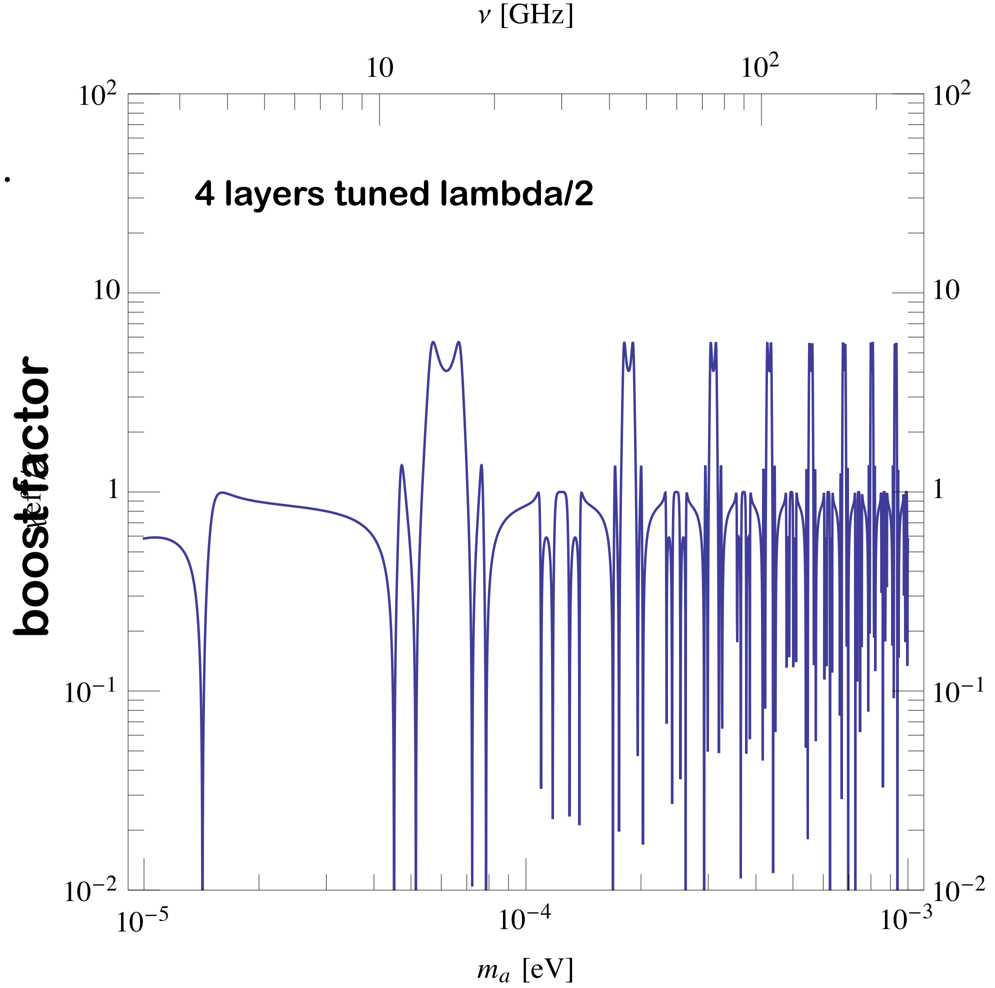
Possible improvement

Enhance the emissivity by multilayers of dielectric



+ back production and all reflexions ...

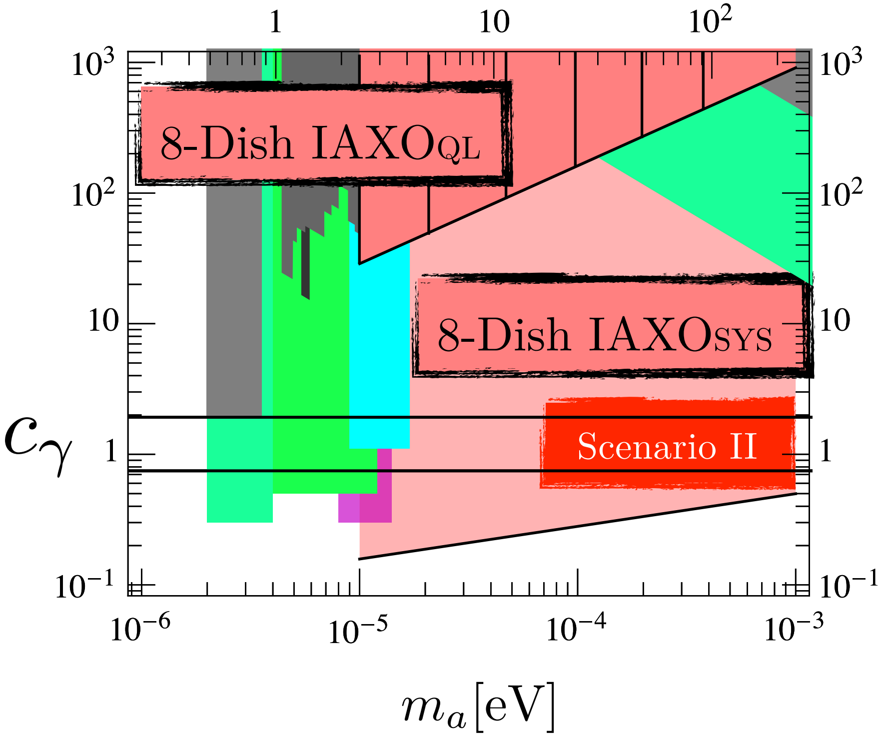
$$|\mathbf{E}_a| \to |\mathbf{E}_a| \times N$$



Increases sensitivity
but losses bandwidth

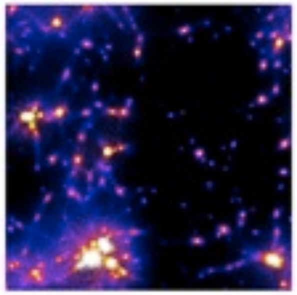
Dish antenna and miniclusters

- Typical Dish antenna experiments fall a bit short, if the DM density is just $\rho_{\rm CDM} = 0.3{\rm GeV/cm}^3$



- 0.1-1 meV range is most interesting in **Scenario-II**

- S-II predicts miniclusters of axion CDM



$$M_{\rm mc} \sim 10^{-12} M_\odot$$
$$\Omega_{mc}/\Omega_{a\rm CDM} \sim O(1)$$

Zurek et al 07, See also Kolb & Tkachev 94

- Encounter with the Earth (every 10^4 years)

$$\rho_{\rm CDM} \times 10^6, Q_a \sim 10^9, t \sim 3{\rm days}$$

- Even with a modest realistic experiment one can get a huge signal ! (if lucky...)

Conclusions

- Axion DM - well motivated and testable
  - but underrepresented (gets better)
  - key targets not covered
  - plenty of new ideas uncovered here

- Cavity experiments on the run
  - micro-eV range by ADMX, ADMX-HF
  - lower masses, IAXO?
  - higher masses, new ideas!

- Dish antenna
  - a little short for axions
  - broadband/miniclusters!
  - boost with dielectric layers!
  - good for ALPs, hidden photons!

Getting better

- New IBS (Institute of Basic Science)
  Center for Axion and Precision Physics (CAPP)
  KAIST campus, Daejeon/Korea

- + in US
    - Yale developing ADMX-HF
    - CASPER

- Europe getting involved
    - CASPER, Budker@Mainz
    - DESY, CERN, Unizar

- International AXion Observatory

main goal:
solar axions
but also DM

IAXO – Conceptual Design

- Large toroidal 8-coil magnet L = ~20 m
- 8 bores: 0.6 m diameter
- 8 x-ray optics + 8 detectio systems
- Rotating platform with services
