

1.3 Feynman rules

Generating functional:

$$Z[J] = \frac{1}{N!} \int \mathcal{D}\phi e^{i\{S[\phi] + \int d^d x J(x) \phi(x)\}} \quad (1.61)$$

with

$$\begin{aligned} & \langle 0 | T \hat{\phi}(x_1) \dots \hat{\phi}(x_n) | 0 \rangle / \langle 0 | 0 \rangle \\ &= (-i)^n \frac{\delta^n Z[J]}{\delta J(x_1) \dots \delta J(x_n)} \Big|_{J=0} \end{aligned} \quad (1.62)$$

where we have used

$$\frac{\delta J(x)}{\delta J(y)} := \delta^d(x-y) \quad (1.63)$$

For the free theory we have

$$Z_0[J] = e^{-\frac{1}{2} \int d^d x d^d y J(x) G(x,y) J(y)} \quad (1.64)$$

$$\text{where } (-\Delta - m^2)_x G(x,y) = i \delta^d(x-y) \quad (1.64)$$

Examples (i) 2-point fct.

$$\begin{aligned} \langle T \varphi(x) \varphi(y) \rangle &= - \frac{\delta^2 Z_0[J]}{\delta J(x) \delta J(y)} \Big|_{J=0} \\ \langle 0 | T \hat{\varphi}(x) \hat{\varphi}(y) | 0 \rangle / \langle 0 | 0 \rangle &= \frac{\delta^2}{\delta J(x) \delta J(y)} \int d^d x' d^d y' J(x) G(x; y') J(y') \\ &= \underbrace{G(x, y)}_{(1.65)} \end{aligned}$$

(ii) 4-point fct.:

$$\begin{aligned} \langle T \varphi(x_1) \dots \varphi(x_4) \rangle &= \frac{\delta^4 Z_0[J]}{\delta J(x_1) \dots \delta J(x_4)} \Big|_{J=0} \\ &= G(x_1, x_2) G(x_3, x_4) \\ &\quad + \text{permuts} \quad (1.66) \end{aligned}$$

Diagrammatically:

$$\langle T \varphi(x_1) \dots \varphi(x_4) \rangle = \begin{array}{c} 1 \text{---} 2 \\ 3 \text{---} 4 \end{array} + \begin{array}{c} 1 \\ | \\ 3 \end{array} \begin{array}{c} 2 \\ | \\ 4 \end{array} + \begin{array}{c} 1 \text{---} 2 \\ \diagdown \diagup \\ 3 \text{---} 4 \end{array}$$

(iii) General $2n$ -point fct.:

$$\begin{aligned} \langle T \varphi(x_1) \cdots \varphi(x_{2n}) \rangle &= (-i) \left. \frac{\delta^m Z[J]}{\delta \varphi(x_1) \cdots \delta \varphi(x_{2n})} \right|_{J=0} \\ &= \frac{(-i)^{2n}}{m!} \frac{\delta^{2n}}{\delta \varphi(x_1) \cdots \delta \varphi(x_{2n})} \left. \frac{(-1)^n}{Z^n} \int d^d x d^d y J(x) G(x,y) J(y) \right. \\ &= G(x_1, x_2) G(x_3, x_4) \cdots G(x_{2n-1}, x_{2n}) \\ &\quad + \text{permuts.} \quad (1.67) \end{aligned}$$

Schwinger functional:

$$\boxed{W[J] = \ln Z[J]} \quad (1.68)$$

In the free case:

$$W_0[J] = \ln Z_0[J] = -\frac{1}{2} \int d^d x d^d y J(x) G(x,y) \cdot J(y) \quad (1.69)$$

and hence

$$\left. (-i)^2 \frac{\delta^2 W_0[J]}{\delta J(x_1) \delta J(x_2)} \right|_{J=0} = G(x_1, x_2) \quad (1.70)$$

In terms of Z_0 this reads

$$\frac{\delta^2 W[J]}{\delta J(x_1) \delta J(x_2)} \Big|_{J=0} = \left(\frac{1}{Z_0[J]} \frac{\delta^2 Z_0}{\delta J(x_1) \delta J(x_2)} - \frac{1}{Z_0} \frac{\delta Z_0}{\delta J(x_1)} \frac{1}{Z_0} \frac{\delta Z_0}{\delta J(x_2)} \right)_{J=0} \quad (1.71)$$

$$= \underbrace{\langle T \varphi(x_1) \varphi(x_2) \rangle}_{\text{connected 2-point fct}} - \langle \varphi(x_1) \rangle \langle \varphi(x_2) \rangle \quad (1.71)$$

$$\text{Here we have } \langle \varphi(x_1) \rangle = \left. \int dx G(x_1, x) J(x) \right|_{J=0} = 0 \quad (1.72)$$

Interacting theory: $S[J] = S_0[J] - \int d^d x V_{\text{int}}(\varphi)$

$$\begin{aligned} Z[J] &= \int \mathcal{D}\varphi e^{i[S_0[\varphi] - \int d^d x V_{\text{int}}(\varphi) + \int d^d x J(x)\varphi(x)]]} \\ &= e^{-i \int d^d x V_{\text{int}}(-i \frac{\delta}{\delta J(x)})} \int \mathcal{D}\varphi e^{i[S_0[\varphi] + \int d^d x J(x)\varphi(x)]}] \\ &\simeq e^{-i \int d^d x V_{\text{int}}(-i \frac{\delta}{\delta J(x)})} Z_0[J] \quad (1.73) \end{aligned}$$

See also QM, eq. (1.44), p. 15.

Using eq. (1.64), p. 21. for Z_0 , we get for

eq. (1.73) :

$$Z[J] \approx e^{-i \int d^d x V_{\text{int}}(-i \frac{\delta}{\delta J(x)})} e^{-\frac{i}{2} \int_{x,y} J(x) G(x,y) J(y)} \quad (1.74)$$

with $\int_x = \int d^d x$, $\int_{x,y} = \int d^d x d^d y$.

Assume for the moment, that $V_{\text{int}}(\cdot)$ is small. Then we can expand Z in powers of V : $J \cdot G \cdot J = J(x) G(x,y) J(y)$

$$\begin{aligned} Z[J] &\approx \left[1 - i \int_x V_{\text{int}} \left(\frac{\delta}{\delta J} \right) - \frac{1}{2} \left(\int_x V_{\text{int}} \left(\frac{\delta}{\delta J} \right) \right)^2 + \dots \right] Z_0[J] \\ &= \left[1 - i \int_x V_{\text{int}} \left(\frac{\delta}{\delta J} \right) + \dots \right] \left(1 - \frac{1}{2} \int_{xy} J \cdot G \cdot J + \frac{1}{8} \left(\int_{xy} J \cdot G \cdot J \right)^2 + \dots \right) \end{aligned} \quad (1.75)$$

In φ^4 -theory we have $V_{\text{int}}(\varphi) = \frac{1}{4!} \varphi(x)^4$

$$\boxed{i \int_x V_{\text{int}} \left(\frac{\delta}{\delta J} \right) = i \frac{\lambda}{4!} \int_x \left(\frac{\delta}{\delta J(x)} \right)^4} \quad (1.76)$$

Diagrammatics in ϕ^4 -theory:

(i) Vacuum 'physics': What is $Z[J]$?

$$\begin{aligned}
 Z[J] &\simeq e^{-i \int_x V_{int}(\frac{\partial}{\partial J})} e^{-\frac{1}{2} \int_{x,y} J \cdot G \cdot J} \Big|_{J=0} \\
 &= 1 - i \int_x V_{int}(\frac{\partial}{\partial J}) \frac{1}{2} \left(\frac{1}{2} \int_{x,y} J \cdot G \cdot J \right)^2 \\
 &\quad - \frac{1}{2} \left[\int_x V(\frac{\partial}{\partial J}) \right]^2 \frac{1}{4!} \left(-\frac{1}{2} \int_{x,y} J \cdot G \cdot J \right)^4 \\
 &\quad + \dots \tag{1.77}
 \end{aligned}$$

(a) Each J -derivative can hit each current J .

(b) Due to the symmetry of G : $G(x,y) = G(y,x)$

we have $\frac{\partial}{\partial J(x_1)} \frac{\partial}{\partial J(x_2)} \frac{1}{2} \int_{x,y} J \cdot G \cdot J = G(x_1, x_2)$.

\Rightarrow (c) we simply have to work-out all permutations

\Rightarrow best done diagrammatically
(or computer)

Dice graphs?

$$-i \frac{\lambda}{4!} \int_x \left(\frac{\delta}{\delta J(x)} \right)^4 \sim \text{X} \quad \text{vertex: } -i\lambda$$

$$(b) \rightarrow -\frac{1}{2} \int_{x,y} j(x) G(x,y) j(y) \sim \overline{x} \overline{y} \quad \text{propagator}$$

'Computation' of $Z[J]$: eq. (1.77)

$$\textcircled{A}: \frac{1}{8} \frac{1}{4!} \text{C}_{4,3}^2 \cdot 4! \quad \begin{matrix} \text{from taking derivatives} \\ \text{permutations of} \\ \text{contracting vertex legs} \\ \text{with props.} \end{matrix}$$

$$= \frac{1}{8} \text{O} = -\frac{i\lambda}{8} \int d^d x G(x,x) G(x,x)$$

divergent, see QFT I

$$\textcircled{B}: \frac{1}{4!} \frac{1}{2^4} \frac{1}{2} \left(\frac{1}{4!} \right)^2 = \frac{1}{X} = \frac{1}{X}$$

$$= \frac{1}{4!} \frac{1}{2^4} \frac{1}{2} \left(\frac{1}{4!} \right)^2 \xrightarrow[\text{(exercise)}]{\text{cont.}} \text{O} + \text{O} \text{ O}$$

$$\text{O}, \text{O} \text{ O}$$

Remark: What about $Z_0[0]$?

We use

$$\begin{aligned} \int d\phi e^{iS_0[\phi]} &\simeq \det^{-1/2}(-\Delta - m^2) \\ &\simeq \det^{1/2} G \end{aligned} \quad (1.78)$$

Furthermore we have

$$\begin{aligned} \det M &= \prod_n \lambda_n = \prod_n e^{\ln \lambda_n} = e^{\sum_n \ln \lambda_n} \\ &= e^{\text{Tr } \ln M} \end{aligned} \quad (1.79)$$

For $Z_0[0]$ this implies

$$Z_0[0] \simeq \det^{1/2} G = e^{\frac{1}{2}\text{Tr } \ln G} \quad (1.80)$$

and $\text{Tr } \ln G = \int d^d x \ln G(x, x)$

or diagrammatically (with $\partial_{m^2} G = iG^2$)

$$\frac{1}{Z_0[0]} \partial_{m^2} Z_0[0] \simeq \frac{i}{2} \bigcirc \quad (1.81)$$

Correlation fcts.:

$$\begin{aligned}
 \langle T\varphi(x_1) \cdots \varphi(x_n) \rangle &= \frac{(-i)^n}{Z[J]} \frac{\delta^n Z[J]}{\delta \varphi(x_1) \cdots \delta \varphi(x_n)} \Big|_{J=0} \\
 &= \frac{(-i)^n}{1 + \text{rec. diag.}} \frac{\delta^n}{\delta \varphi(x_1) \cdots \delta \varphi(x_n)} e^{-i \int_x V_{\text{int}}(\frac{\delta}{\delta J})} e^{-i \int_{x,y} J \cdot G \cdot J} \\
 &= (-i)^n \left[\frac{\delta^n}{\delta \varphi(x_1) \cdots \delta \varphi(x_n)} e^{-i \int_x V_{\text{int}}(\frac{\delta}{\delta J})} e^{-i \int_{x,y} J \cdot G \cdot J} \right] \\
 &\quad \text{no rec. diag.} \\
 &\quad (1.82)
 \end{aligned}$$

\Rightarrow Feynman rules:

Propagator: $\overline{x-y} = G(x, y)$

Vertex: $\times = -i \lambda \int d^4 x$

- (a) Write down all diagrams in a given order N of λ of $2n$ -point correlation fct.

- (b) Combinatorial factors of diagrams

$$\begin{aligned}
 &\left(\frac{1}{4!} \right)^N \frac{1}{N! (2n+m)!} \frac{1}{2^{2n+m}} (\text{perm.}) \\
 &\sum_N \left(\frac{1}{4!} \right)^N \frac{1}{N!} \left[\int_x \frac{\delta}{\delta J} \right]^N \frac{1}{(2n+m)!} \left[\int_{x,y} J \cdot G \cdot J \right]^{2n+m} \\
 &\quad \text{N loops}
 \end{aligned}$$

Example: 2-point fct.

$$\langle T \varphi(x_1) \varphi(x_2) \rangle = \overrightarrow{x_1 x_2} + \frac{1}{2} \text{---} \bigcirc + \dots$$

$\frac{1}{3!} \frac{1}{8} \quad \frac{1}{4!} \cdot 4! \quad 4 \cdot 6$
 $\frac{1}{2!} \frac{1}{2^6} (\partial J)^3 \quad \frac{1}{4!} \left(\frac{\partial}{\partial J} \right)^4 \cdot \frac{1}{\partial J(x_1) \partial J(x_2)}$

The above results extend straightforwardly to general scalar theories.

$$\text{Example: } S[\varphi, \phi] = \frac{1}{2} \int_x \{ \varphi(-\Delta - m_\varphi^2) \varphi + \phi(-\Delta - m_\phi^2) \phi - \frac{1}{2} \int_x \phi \varphi^2 \quad (1.83)$$

Generating functional:

$$\begin{aligned} Z[J_\varphi, J_\phi] &= \int \mathcal{D}\varphi \mathcal{D}\phi e^{i \{ S[\varphi, \phi] + \int_x (J_\varphi \varphi + J_\phi \phi) \}} \\ &\approx e^{-\frac{i}{2} \int_x \frac{\delta}{\delta J_\varphi} \frac{\delta^2}{\delta J_\varphi^2}} Z_0[J_\varphi, J_\phi] \end{aligned}$$

with

$$Z_0[J_\varphi, J_\phi] = e^{-\frac{i}{2} \int_{x,y} (J_\varphi \cdot G_{\varphi\varphi} J_\varphi + J_\phi \cdot G_{\varphi\phi} J_\phi)} \quad (1.84)$$

$$(-\Delta_x - m_\varphi^2) G_{\varphi\phi}(x, y) = i \delta(x-y) \quad (1.85)$$

Wick rotation & statistical interpretation

The functional integrals are defined with measures $d\varphi e^{iS[\varphi]}$. For practical purposes (perturbative evaluation, numerics) it is convenient and necessary, to perform a Wick rotation (see also QFT I):

$$\boxed{x_{0M} \rightarrow -i x_{0E}} : \boxed{e^{-i\Delta t H} \rightarrow e^{-\Delta t H}}$$

$$\Rightarrow i \int d^d x_M \rightarrow + \int d^d x_E \quad (1.86)$$

$$- \partial_\mu \partial^\mu \rightarrow + \partial_\mu \partial_\mu$$

φ scalar: $\varphi \rightarrow \varphi$

$$\Rightarrow i \underbrace{\int d^d x \left\{ \frac{1}{2} \varphi (-\partial_\mu \partial^\mu) \varphi - V(\varphi) \right\}}_{S[\varphi] \text{ Minkowski}} \quad (1.87)$$

$$\rightarrow - \underbrace{\int d^d x \left\{ \frac{1}{2} \varphi (-\partial_\mu \partial^\mu) \varphi + V(\varphi) \right\}}_{S[\varphi] \text{ Euclidean}}$$

$$\boxed{S[\varphi] \geq 0}$$

Generating Functional:

$$Z_{\text{Euclidean}}[J] = \int \mathcal{D}\varphi e^{-S[\varphi] + \int d^d x J(x) \varphi(x)} \quad (1.88)$$

with $\langle T \varphi(x) \cdots \varphi(x_n) \rangle_{\text{Eud.}} = \frac{\delta^n Z}{\delta \varphi(x_1) \cdots \delta \varphi(x_n)}$ (1.89)

Free Theory: $S_0[J] = \int d^d x \varphi(-\Delta_E + m^2) \varphi$

$$\begin{aligned} Z_0[J] &= \int \mathcal{D}\varphi e^{-S_0[\varphi] + \int d^d x J(x) \varphi(x)} \\ &= \det^{-1/2} \underbrace{(-\Delta + m^2)}_{\geq 0} e^{\frac{1}{2} \int d^d x J(x) G(x,y) J(y)} \end{aligned} \quad (1.90)$$

with $(-\Delta + m^2) G(x,y) = \delta^d(x-y)$ (1.91)

Wick rotation on Propagators

$$G_\mu(p) = \frac{i}{p_\mu^2 - m^2 + i\varepsilon} \rightarrow G_E(p) = \frac{1}{p^2 + m^2}$$

Vertex

$$-i\lambda \rightarrow -\lambda$$

The Euclidean functional integral is a statistical integral with statistical measure $d\varphi e^{-S[\varphi]}$ (not normalised).

The Schwinger functional is nothing but the free energy F .

Euclidean correlation fcts. can be Wick-rotated back to Minkowski space (or real time), where they provide the real-time correlation fcts.:

$$\boxed{\begin{aligned} & \langle T \varphi(x_1) \cdots \varphi(x_n) \rangle_{\text{Eud.}} (x_i \in \mathbb{R}^d \rightarrow i x_i \in \mathbb{R}^d) \\ &= \langle T \varphi(x_1) \cdots \varphi(x_n) \rangle_{\text{Mink.}} \end{aligned}} \quad (1.92)$$
