

St Gerlach - exp

classical description

$$\vec{\mu} = -\underbrace{\frac{e\hbar}{2mc}}_{\text{Landé factor}} \underbrace{g}_{\text{Landé factor}} \underbrace{\vec{J}}_{\text{angular momentum}/\hbar}$$

$\vec{B}$  uniform (indep. of  $\vec{x}$ )

angular momentum  $\Rightarrow$  precession of  $\vec{\mu}$  around  $\vec{B}$ -axis

$\rightarrow$  no deflection

$$\frac{\partial \vec{B}}{\partial x_3} > 0$$

deflection upwards

expect

quantum description

$$H = \mu \cdot \vec{B}(\vec{x}) \cdot \vec{\sigma} + \frac{\vec{p}^2}{2m}$$

cf classical  $\vec{\mu} \cdot \vec{B} = \mu B \hat{n} \cdot (\sigma_1, \sigma_2, \sigma_3)$

$$\vec{B}(\vec{x}) = x_3 \cdot \vec{B}' \quad \vec{B}' = B' \begin{pmatrix} \sin \theta \\ 0 \\ \cos \theta \end{pmatrix}$$

$$H = \mu \cdot B' \cdot (\sin \theta \sigma_1 + \cos \theta \sigma_3)$$

$$= \mu B' (|+\theta\rangle\langle+\theta| - |-\theta\rangle\langle-\theta|)$$

where  $(\sin \theta \sigma_1 + \cos \theta \sigma_3) |\pm, \theta\rangle = \pm |\pm, \theta\rangle$

magnet corresponds to a measuring device i.e. an observable

$$A_\theta = |+\theta\rangle\langle+\theta| - |-\theta\rangle\langle-\theta|$$

$$|+\theta\rangle = \begin{pmatrix} \cos \frac{\theta}{2} \\ \sin \frac{\theta}{2} \end{pmatrix} \quad |-\theta\rangle = \begin{pmatrix} -\sin \frac{\theta}{2} \\ \cos \frac{\theta}{2} \end{pmatrix}$$

incoming particles in a state  $|\psi\rangle$

$$p_{\pm}(\theta) = |\langle \pm, \theta | \psi \rangle|^2$$

$$p_+(\theta) + p_-(\theta) = \langle \psi | \psi \rangle = 1$$

after the measurement with outcome "-" the particles are in the state  $|-\theta\rangle$

$P_+(\theta) = |+\theta\rangle\langle+\theta|$   
blocking of one beam  $\rightarrow$  projection

$$|z\rangle = |+, 0\rangle$$

$$|-z\rangle = |-, 0\rangle$$

$$|+z\rangle = |+\theta\rangle\langle+\theta|+z\rangle + |-\theta\rangle\langle-\theta|+z\rangle$$

$$q_{\pm}(\theta) = |\langle \pm, \theta | +z \rangle|^2$$

$$|+z\rangle = \begin{pmatrix} 1 \\ 0 \end{pmatrix}$$

$$|-z\rangle = \begin{pmatrix} 0 \\ 1 \end{pmatrix}$$

$$q_+(\theta) = \cos^2 \frac{\theta}{2}$$

$$q_-(\theta) = \sin^2 \frac{\theta}{2}$$

Why replace  $\vec{L}$  by  $\vec{J}$ ?

The qm def. of angular momentum is as the generator of rotations: if  $\vec{x}' = R\vec{x}$   $R \in \text{SO}(3)$

then  $\psi'(R\vec{x}) = (U(R)\psi)(\vec{x})$

e.g. take  $R = R_1(\alpha)$

$$R_1(\alpha) = e^{i\alpha \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & -1 \\ 0 & 1 & 0 \end{pmatrix}} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & \cos\alpha & -\sin\alpha \\ 0 & \sin\alpha & \cos\alpha \end{pmatrix}$$

$$\left. \frac{d}{dx} \psi(R(x)\vec{x}) \right|_{x=0} = (\nabla\psi)(R(x)\vec{x}) \cdot \left. \frac{dR(x)\vec{x}}{dx} \right|_{x=0}$$

$$= i(\nabla\psi)(\vec{x}) \cdot \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & -1 \\ 0 & 1 & 0 \end{pmatrix} \vec{x}$$

$$= i(\nabla\psi)(\vec{x}) \cdot \begin{pmatrix} x_2 \\ -x_3 \\ x_1 \end{pmatrix}$$

$$= i x_2 \frac{\partial \psi}{\partial x_3} - i x_3 \frac{\partial \psi}{\partial x_2}$$

$$= -J_1$$

where  $\vec{J} = \vec{x} \times \frac{1}{i} \nabla - \vec{x} \times \vec{p}$

$$U(R) = e^{-i\vec{L} \cdot \vec{\theta}}$$

$$L_1 = \frac{1}{i} x_2 \frac{\partial}{\partial x_3} - \frac{1}{i} x_3 \frac{\partial}{\partial x_2}$$

$$\vec{L} = \vec{x} \times \frac{1}{i} \nabla$$

$\vec{L}$  satisfies  $[L_j, L_k] = i\hbar \epsilon_{jkl} L_l$  (\*)

$\vec{\Sigma} = \frac{\hbar}{2} \vec{\sigma} \rightarrow [\Sigma_j, \Sigma_k] = i\hbar \epsilon_{jkl} \Sigma_l$  (spin  $\frac{1}{2}$  - representation of (\*))

Convention: we write this as a column vector

$$v \otimes w = \begin{pmatrix} v_1 w_1 \\ v_1 w_2 \\ \vdots \\ v_1 w_n \\ v_2 w_1 \\ v_2 w_2 \\ \vdots \\ v_2 w_n \\ \vdots \\ v_m w_1 \\ \vdots \\ v_m w_n \end{pmatrix} = \begin{pmatrix} v_1 w \\ \vdots \\ v_m w \end{pmatrix} \quad (e_i \otimes e_j)_{\substack{1 \leq i \leq m \\ 1 \leq j \leq n}}$$

is an ONB of  $\mathbb{C}^m \otimes \mathbb{C}^n$

$$e_i = \begin{pmatrix} \delta_{ij} \\ \vdots \\ 0 \end{pmatrix}$$

### QM of composite systems

(goal: describe many qbits)

Tensor product of vector spaces.

$$\mathbb{C}^m \otimes \mathbb{C}^n \cong \mathbb{C}^{m \cdot n}$$

$$v = \begin{pmatrix} v_1 \\ v_2 \\ \vdots \\ v_m \end{pmatrix} \quad w = \begin{pmatrix} w_1 \\ w_2 \\ \vdots \\ w_n \end{pmatrix} \quad (v \otimes w)_{ij} = v_i \cdot w_j$$

$$v \otimes w = \begin{pmatrix} v_1 w_1 & v_1 w_2 & \dots & v_1 w_n \\ v_2 w_1 & v_2 w_2 & \dots & v_2 w_n \\ \vdots & \vdots & \ddots & \vdots \\ v_m w_1 & v_m w_2 & \dots & v_m w_n \end{pmatrix}$$

$$A \in M_m(\mathbb{C}), B \in M_n(\mathbb{C})$$

$$A v \otimes B w = \begin{pmatrix} (A v)_1 (B w)_1 \\ \vdots \\ (A v)_m (B w)_n \end{pmatrix} = \begin{pmatrix} (A v)_1 \cdot B w \\ \vdots \\ (A v)_m \cdot B w \end{pmatrix}$$

$$(A \otimes B) = \begin{pmatrix} A_{11} B & A_{12} B & \dots & A_{1m} B \\ A_{21} B & A_{22} B & \dots & A_{2m} B \\ \vdots & \vdots & \ddots & \vdots \\ A_{m1} B & A_{m2} B & \dots & A_{mn} B \end{pmatrix}$$

For Hilbert spaces  $V$  and  $W$ ,  $V \otimes W$  is def'd in a basis-independent way as a space of bilinear forms. It has the properties

(i) If  $(e_j)_j$  is an ONB of  $V$  and  $(f_i)_i$  is an ONB of  $W$  then  $e_j \otimes f_i \rightarrow$  of  $V \otimes W$

$$(ii) \langle v_1 \otimes w_1 | v_2 \otimes w_2 \rangle = \langle v_1 | v_2 \rangle \langle w_1 | w_2 \rangle$$

Similarly  $\langle v_1 \otimes \dots \otimes v_n | w_1 \otimes \dots \otimes w_n \rangle = \prod_{j=1}^n \langle v_j | w_j \rangle$

$A_i$  is an operator on  $V_i$ , then

$$(A_1 \otimes \dots \otimes A_n)(v_1 \otimes \dots \otimes v_n) = (A_1 v_1) \otimes (A_2 v_2) \otimes \dots \otimes (A_n v_n)$$

in particular

$$(A_1 \otimes 1)(v_1 \otimes v_2) = (A_1 v_1) \otimes v_2$$

is an operator that acts only on component 1.

NB: a general element of  $V \otimes W$  is not of the form  $v \otimes w$  with  $v \in V$   $w \in W$  but a linear combination  $v_1 \otimes w_1 + \dots + v_l \otimes w_l$  for some  $l$ .

It is in general a hard problem to determine if a given vector  $u \in V_1 \otimes \dots \otimes V_n$  is a simple product  $u = v_1 \otimes \dots \otimes v_n$  or not. If not, one calls it entangled ("verschränkt")

## N. Classical and quantum networks

### N.1 Overview

classical	quantum
bits 0, 1	qubits $ 0\rangle,  1\rangle \in \mathbb{C}^2$
input: bit string $011010110011$ (cartesian product)	vector $ 0110\dots\rangle =  0\rangle \otimes  1\rangle \otimes  1\rangle \otimes  0\rangle \dots$ (tensor product)
map: $f: \{0,1\}^n \rightarrow \{0,1\}^n$ bijective	$U: (\mathbb{C}^2)^{\otimes n} \rightarrow (\mathbb{C}^2)^{\otimes n}$ unitary
output: string $s' = f(0110\dots)$	a probabilistic ensemble def'd by $ \psi\rangle = U \psi_{in}\rangle = U 0110\dots\rangle$
finite many such $f$	a continuum of $U$ 's
problem: universal gates that can build up the network	

Classical case: Let  $f: \{0,1\}^n \rightarrow \{0,1\}^n$  be bijective. Then  $f$  is a composition of NOT gates and Toffoli gates

$$B = \{0,1\}$$

$$N_i: B^n \rightarrow B^n \quad (x_1, \dots, x_n) \mapsto (x_1, \dots, x_i, \dots, x_n)$$

$$O_{jkl}: B^n \rightarrow B^n \quad x \mapsto y$$

$$x'_j = \begin{cases} x_j & j \neq i \\ 1 - x_j & j = i \end{cases}$$

$$y_i = x_i + x_j x_k$$

$$y_m = x_m \quad \text{for } m \neq i$$
