Dilaton quantum gravity and cosmology

Dilaton quantum gravity

Dilaton Quantum Gravity

T. Henz, J. M. Pawlowski, A. Rodigast, and C. Wetterich

Functional renormalization flow, with truncation :

$$\Gamma_k = \int d^4x \sqrt{g} \left(V_k(\chi^2) - \frac{1}{2} F_k(\chi^2) R + \frac{1}{2} g^{\mu\nu} \partial_\mu \chi \partial_\nu \chi \right)$$

Functional renormalization equations

$$V_k = k^4 y^2 v_k(y), \ F_k = k^2 y f_k(y)$$

$$y = \frac{\chi^2}{k^2}$$

$$\partial_t v_k(y) = 2y v'_k(y) + \frac{1}{y^2} \zeta_V$$

$$\partial_t f_k(y) = 2y f'_k(y) + \frac{1}{y} \zeta_F.$$

$$\begin{aligned} \zeta_V &= \frac{1}{192\pi^2} \Biggl\{ 6 + \frac{30\,\tilde{V}}{\Sigma_0} + \frac{3(2\Sigma_0 + 24\,y\,\tilde{F}'\,\Sigma_0' + \,\tilde{F}\Sigma_1)}{\Delta} \\ &+ \delta_V \Biggr\}, \end{aligned}$$

$$\zeta_{F} = \frac{1}{1152\pi^{2}} \Biggl\{ 150 + \frac{30\,\tilde{F}\,(3\,\tilde{F} - 2\tilde{V})}{\Sigma_{0}^{2}}$$
(10)
$$-\frac{12}{\Delta} \left(24\,y\,\tilde{F}'\,\Sigma_{0}' + 2\Sigma_{0} + \tilde{F}\Sigma_{1} \right) - 6y\,(3\,\tilde{F}'^{2} + 2\Sigma_{0}'^{2}) -\frac{36}{\Delta^{2}} \Biggl[2y\,\Sigma_{0}\,\Sigma_{0}'\,(7\,\tilde{F}' - 2\tilde{V}')\,(\Sigma_{1} - 1) + 2\,\Sigma_{0}^{2}\,\Sigma_{2} \Biggr\}$$

$$+2 y \Sigma_1 \left(7 \tilde{F}' - 2 \tilde{V}'\right) \left(2 \Sigma_0 \tilde{V}' - \tilde{V} \Sigma_0'\right) +24 y \tilde{F}' \Sigma_0 \Sigma_0' \Sigma_2 - 12 y \tilde{F} \Sigma_0'^2 \Sigma_2 \right] + \delta_F \bigg\}.$$

$$\begin{split} \tilde{V} &= y^2 \, v_k(y) \ , \ \tilde{F} &= y \, f_k(y), \\ \Sigma_0 &= \frac{1}{2} \tilde{F} - \tilde{V} \ , \ \Delta &= (12 \, y \, \Sigma_0'^2 + \Sigma_0 \, \Sigma_1) \\ \Sigma_1 &= 1 + 2 \, \tilde{V}' + 4 \, y \, \tilde{V}'' \ , \ \Sigma_2 \ &= \ \tilde{F}' + 2 \, y \, \tilde{F}''. \end{split}$$

Percacci, Narain

Fixed point for large scalar field

$$\lim_{y \to \infty} f(y) = \xi$$

$$\lim_{y \to \infty} v(y) = 0$$

$$\Gamma = \int d^4x \sqrt{g} \left(\frac{1}{2} g^{\mu\nu} \partial_{\mu} \chi \, \partial_{\nu} \chi - \frac{1}{2} \xi \chi^2 \, R \right)$$

This fixed point describes already realistic gravity ! Limit $k \rightarrow 0$ can be taken !

Fixed point for large scalar field

Vicinity of fixed point

$$V = \frac{\zeta_V}{4}k^4 + \bar{V},$$

$$F = \xi\chi^2 + \frac{\bar{\zeta}_F}{2}k^2 + \bar{F}$$

 $\frac{1}{1728\pi^2} \left(249 - 41 \frac{\partial_t f_0}{f_0}\right)$

$$\Gamma = \int d^4x \sqrt{g} \left(\frac{1}{2} g^{\mu\nu} \partial_\mu \chi \, \partial_\nu \chi - \frac{1}{2} (\xi \chi^2 + \bar{F}) \, R + \bar{V} \right)$$

Cosmology with dynamical dark energy! Cosmological constant vanishes asymptotically !

full scaling solution behavior for negative kinetic term close to conformal value

a guess for dilaton quantum gravity and its cosmological consequence

Crossover in quantum gravity

Approximate scale symmetry near fixed points

UV : approximate scale invariance of primordial fluctuation spectrum from inflation

 IR : almost massless pseudo-Goldstone boson (cosmon) responsible for dynamical Dark Energy

Variable Gravity

$$\Gamma = \int_x \sqrt{g} \left\{ -\frac{1}{2}\chi^2 R + \mu^2 \chi^2 + \frac{1}{2} \left(B(\chi/\mu) - 6 \right) \partial^\mu \chi \partial_\mu \chi \right\}$$

scale invariant for $\mu = 0$ and B const. quantum effects : flow equation for kinetial

$$\mu \frac{\partial B}{\partial \mu} = \frac{\kappa \sigma B^2}{\sigma + \kappa B}$$

Variable Gravity

- Scalar field coupled to gravity
- Effective Planck mass depends on scalar field
- Simple quadratic scalar potential involves intrinsic mass μ
- Nucleon and electron mass proportional to dynamical Planck mass
- Neutrino mass has different dependence on scalar field

$$\Gamma = \int_x \sqrt{g} \left\{ -\frac{1}{2} \chi^2 R + \mu^2 \chi^2 + \frac{1}{2} \left(B(\chi/\mu) - 6 \right) \partial^\mu \chi \partial_\mu \chi \right\}$$

No tiny dimensionless parameters (except gauge hierarchy)

• one mass scale $\mu = 2 \cdot 10^{-33} \text{ eV}$

• one time scale $\mu^{-1} = 10^{10} \text{ yr}$

Planck mass does not appearPlanck mass grows large dynamically

Infrared fixed point

$$\Gamma = \int_x \sqrt{g} \left\{ -\frac{1}{2}\chi^2 R + \mu^2 \chi^2 + \frac{1}{2} \left(B(\chi/\mu) - 6 \right) \partial^\mu \chi \partial_\mu \chi \right\}$$

no intrinsic mass scalescale symmetry

Fixed points and limits for scalar field

Dimensionless functions as B depend only on ratio μ/χ.
IR: μ→0 , χ→∞ / y→∞
UV: μ→∞ , χ→0 / y→0

Cosmology makes crossover between fixed points by variation of χ.

Ultraviolet fixed point

kinetial diverges

$$B = b \left(\frac{\mu}{\chi}\right)^{\sigma} = \left(\frac{m}{\chi}\right)^{\sigma}$$

\square scale symmetry with anomalous dimension σ

$$g_{\mu\nu} \to \alpha^2 g_{\mu\nu} , \ \chi \to \alpha^{-\frac{2}{2-\sigma}} \chi$$

Renormalized field at UV fixed point

$$\chi_R = b^{\frac{1}{2}} \left(1 - \frac{\sigma}{2} \right)^{-1} \mu^{\frac{\sigma}{2}} \chi^{1 - \frac{\sigma}{2}}$$

$$\Gamma_{UV} = \int_x \sqrt{g} \left\{ \frac{1}{2} \partial^\mu \chi_R \partial_\mu \chi_R - \frac{1}{2} C R^2 + D R^{\mu\nu} R_{\mu\nu} \right\}$$

 $1 < \sigma < 2$

no mass scale

deviation from fixed point vanishes for

 $\mu \rightarrow \infty$

$$\Delta\Gamma_{UV} = \int_x \sqrt{g} E\left(\mu^2 - \frac{R}{2}\right) \mu^{-\frac{2\sigma}{2-\sigma}} \chi_R^{\frac{4}{2-\sigma}},$$

$$E = b^{-\frac{2}{2-\sigma}} \left(1 - \frac{\sigma}{2}\right)^{\frac{4}{2-\sigma}}$$

Asymptotic safety

if UV fixed point exists :

quantum gravity is

non-perturbatively renormalizable !

S. Weinberg, M. Reuter

Quantum scale symmetry

quantum fluctuations violate scale symmetry
 running dimensionless couplings
 at fixed points , scale symmetry is exact !

Crossover between two fixed points

$$\mu \frac{\partial B}{\partial \mu} = \frac{\kappa \sigma B^2}{\sigma + \kappa B}$$

$$B^{-1} - \frac{\kappa}{\sigma} \ln B = \kappa \left[\ln \left(\frac{\chi}{\mu} \right) - c_t \right] = \kappa \ln \left(\frac{\chi}{m} \right)$$

m : scale of crossover can be exponentially larger than intrinsic scale μ

Origin of mass

 UV fixed point : scale symmetry unbroken all particles are massless

 IR fixed point : scale symmetry spontaneously broken, massive particles , massless dilaton

 \square crossover : explicit mass scale μ or m important

 SM fixed point : approximate scale symmetry spontaneously broken, massive particles , almost massless cosmon, tiny cosmon potential

Cosmological solution : crossover from UV to IR fixed point

Dimensionless functions as B depend only on ratio μ/χ.
IR: μ→0 , χ→∞
UV: μ→∞ , χ→0

Cosmology makes crossover between fixed points by variation of χ.

SM

simple description of all cosmological epochs

natural incorporation of Dark Energy : inflation

Early Dark Energy

present Dark Energy dominated epoch

Model is compatible with present observations

Together with variation of neutrino mass over electron mass during second stage of crossover : model is compatible with all present observations

$$\Gamma = \int_x \sqrt{g} \left\{ -\frac{1}{2}\chi^2 R + \mu^2 \chi^2 + \frac{1}{2} \left(B(\chi/\mu) - 6 \right) \partial^\mu \chi \partial_\mu \chi \right\}$$

$$B^{-1} - \frac{\kappa}{\sigma} \ln B = \kappa \left[\ln \left(\frac{\chi}{\mu} \right) - c_t \right] = \kappa \ln \left(\frac{\chi}{m} \right)$$

Expansion

Inflation **Radiation** : Universe shrinks Matter Dark Energy : Universe expands

- : Universe shrinks
- Strahlungsdominiertes Universum **Dunkle Energi**

Big bang or freeze ?

NATURE | NEWS

Cosmologist claims Universe may not be expanding **Particles' changing masses could explain why distant galaxies appear to be rushing away.**

Jon Cartwright 16 July 2013

German physicist stops Universe 25.07.2013

Sonntagszeitung Zürich Laukenmann

The Universe is shrinking

The Universe is shrinking ... while Planck mass and particle masses are increasing

Redshift

instead of redshift due to expansion :

smaller frequencies have been emitted in the past, because electron mass was smaller !

What is increasing ?

Ratio of distance between galaxies over size of atoms !

atom size constant : expanding geometry

alternative : shrinking size of atoms

general idea not new : Hoyle, Narlikar,...

Different pictures of cosmology

- same physical content can be described by different pictures
- related by field redefinitions , e.g. Weyl scaling , conformal scaling of metric
 which picture is usefull ?

Cosmological scalar field (cosmon)

scalar field is crucial ingredient

particle masses proportional to scalar field – similar to Higgs field

particle masses increase because value of scalar field increases

scalar field plays important role in cosmology

cosmon : pseudo Goldstone boson of spontaneously broken scale symmetry

Cosmon inflation

Unified picture of inflation and dynamical dark energy

Cosmon and inflaton are the same scalar field

Dynamical dark energy, generated by scalar field (cosmon)

C.Wetterich,Nucl.Phys.B302(1988)668, 24.9.87 P.J.E.Peebles,B.Ratra,ApJ.Lett.325(1988)L17, 20.10.87

homogeneous dark energy influences recent cosmology

- of same order as dark matter -

Original models do not fit the present observations modifications (different growth of neutrino mass)

Hot plasma ?

Temperature in radiation dominated Universe : T ~ χ^{1/2} smaller than today
Ratio temperature / particle mass : T /m_p ~ χ^{-1/2} larger than today
T/m_p counts ! This ratio decreases with time.

Nucleosynthesis, CMB emission as in standard cosmology !

Infinite past : slow inflation

$\sigma = 2$: field equations

$$\ddot{\chi} + \left(3H + \frac{1}{2}\frac{\dot{\chi}}{\chi}\right)\dot{\chi} = \frac{2\mu^2\chi^2}{m} \qquad H = \sqrt{\frac{\mu^2}{3} + \frac{m\dot{\chi}^2}{6\chi^3}} - \frac{\dot{\chi}}{\chi}$$

solution

$$H = \frac{\mu}{\sqrt{3}} , \ \chi = \frac{3^{\frac{1}{4}}m}{2\sqrt{\mu}} (t_c - t)^{-\frac{1}{2}}$$

 χ

Slow Universe

$$H = \frac{\mu}{\sqrt{3}} , \ \chi = \frac{3^{\frac{1}{4}}m}{2\sqrt{\mu}} (t_c - t)^{-\frac{1}{2}}$$

 $\mu = 2 \cdot 10^{-33} \, \text{eV}$

Expansion or shrinking always slow , characteristic time scale of the order of the age of the Universe : t_{ch} ~ µ⁻¹ ~ 10 billion years !
Hubble parameter of the order of present Hubble parameter for all times , including inflation and big bang !
Slow increase of particle masses !

Spectrum of primordial density fluctuations

Anomalous dimension determines spectrum of primordial fluctuations

$$r = \frac{0.26}{\sigma} \qquad n = 1 - \frac{0.065}{\sigma} \cdot \left(1 + \frac{\sigma - 2}{4}\right)$$

$$\sigma = 2$$

$$r=0.13\ ,\ n=0.967$$

Amplitude of density fluctuations

small because of logarithmic running near UV fixed point !

$$\mathcal{A} = \frac{(N+3)^3}{4} e^{-2c_t} \qquad c_t = \ln\left(\frac{m}{\mu}\right) = 14$$

$$\frac{m}{\mu} = \frac{(N+3)^{\frac{3}{2}}}{2\sqrt{\mathcal{A}}} = 1.32 \cdot 10^6 \left(\frac{N}{60}\right)^{\frac{3}{2}}$$

N : number of e – foldings at horizon crossing

First step of crossover ends inflation

induced by crossover in B

$$B^{-1} - \frac{\kappa}{\sigma} \ln B = \kappa \left[\ln \left(\frac{\chi}{\mu} \right) - c_t \right] = \kappa \ln \left(\frac{\chi}{m} \right)$$

after crossover B changes only very slowly

Scaling solutions near SM fixed point (approximation for constant B)

$$H = b\mu$$
, $\chi = \chi_0 \exp(c\mu t)$

Different scaling solutions for radiation domination and matter domination

conclusions

- crossover in quantum gravity is reflected in crossover in cosmology
- quantum gravity becomes testable by cosmology
- quantum gravity plays a role not only for primordial cosmology
- crossover scenario explains different cosmological epochs
- simple model is compatible with present observations
- no more parameters than ΛCDM : tests possible

end

Einstein frame

$$g'_{\mu\nu} = \frac{\chi^2}{M^2} g_{\mu\nu} , \ \varphi = \frac{2M}{\alpha} \ln\left(\frac{\chi}{\mu}\right)$$

$$\Gamma = \int_{x} \sqrt{g'} \left\{ -\frac{1}{2} M^2 R' + V'(\varphi) + \frac{1}{2} k^2(\varphi) \partial^{\mu} \varphi \partial_{\mu} \varphi \right\}$$

$$V'(\varphi) = M^4 \exp\left(-\frac{\alpha\varphi}{M}\right)$$

$$k^2 = \frac{\alpha^2 B}{4}$$

Einstein frame

Weyl scaling maps variable gravity model to Universe with fixed masses and standard expansion history.

Standard gravity coupled to scalar field.

Only neutrino masses are growing.
