Standard–Model effective theory

A brief history of our Standard–Model mess...

- Fermi 1934: theory of weak interactions $[n \rightarrow p e^- \bar{\nu}_e]$
 $(2 \rightarrow 2)$ transition amplitude $\mathcal{A} \propto G_F E^2$
unitarity violation
pre-80s effective theory for $E < 600$ GeV
- Yukawa 1935: massive particle exchange
Fermi's theory for $E \ll M$
four fermions unitary for $E \gg M$: $\mathcal{A} \propto g^2 E^2 / (E^2 - M^2)$
unitarity violation in $WW \rightarrow WW$
current effective theory for $E < 1.2$ TeV [LHC energy!!]

Standard–Model effective theory

A brief history of our Standard–Model mess...

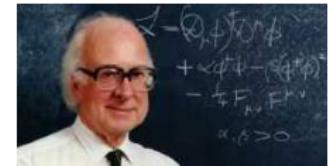

- Fermi 1934: theory of weak interactions $[n \rightarrow p e^- \bar{\nu}_e]$
 $(2 \rightarrow 2)$ transition amplitude $\mathcal{A} \propto G_F E^2$
unitarity violation
pre-80s effective theory for $E < 600$ GeV

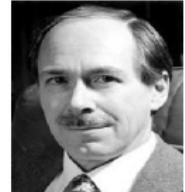

- Yukawa 1935: massive particle exchange
Fermi's theory for $E \ll M$
four fermions unitary for $E \gg M$: $\mathcal{A} \propto g^2 E^2 / (E^2 - M^2)$
unitarity violation in $WW \rightarrow WW$
current effective theory for $E < 1.2$ TeV [LHC energy!!]

- Higgs 1964: spontaneous symmetry breaking
unitarity for massive W, Z
unitarity for massive fermions
fundamental scalar below TeV [mass unknown]

- 't Hooft & Veltman 1971: renormalizability
beware of $1/M$
gauge theories without cut-off
truly fundamental theory

Standard–Model effective theory

Our Standard Model

- gauge theory $SU(3) \times SU(2) \times U(1)$
 - massless $SU(3)$ and $U(1)$ gauge bosons
 - massive $SU(2)$ gauge bosons [spontaneous symmetry breaking]
 - massive Dirac fermions [via Yukawas]
 - perturbatively renormalizable Lagrangian [no effective theory]
 - one missing piece: Higgs [fundamental? minimal? mass?]
- ⇒ defined by particle content, interactions, renormalizability
- ⇒ truly fundamental theory at high energies

How complete experimentally?

- dark matter? [solid evidence! — for weak-scale new physics?]
 - $(g - 2)_\mu$? [possible evidence for weak-scale new physics?]
 - quark mixing — flavor physics? [new operators above 10^4 GeV?]
 - neutrino masses and mixing? [see-saw at 10^{11} GeV?]
 - matter–antimatter asymmetry? [universe mostly matter]
 - gauge–coupling unification? [almost perfect, but proton stable]
 - gravity? [mostly negligible but perturbatively non-renormalizable]
- ⇒ cut-off scale unavoidable: SM effective theory

Standard–Model effective theory

Consistency of fundamental theory

- remember: fundamental Higgs to save gauge theories at high energies
 - problem of light Higgs: mass driven to cutoff of effective Standard Model
$$\delta m_H^2 \propto g^2/m_W^2 (2m_W^2 + m_Z^2 + m_H^2 - 4m_t^2) \Lambda^2$$
 - cancelled by counter term, cosmological constant tuned anyway
but problems not linked [‘weakless universe’: Harnik, Kribs, Perez]
 - or new physics at TeV scale:
 - supersymmetry [my favorite]
 - extra dimensions [cool idea]
 - little Higgs [old idea, now working]
 - composite Higgs, no Higgs... [tough]
- ⇒ fundamental Higgs without TeV-scale completion useless

$$\delta m_H^2 \propto g^2/m_W^2 (2m_W^2 + m_Z^2 + m_H^2 - 4m_t^2) \Lambda^2$$
 - cancelled by counter term, cosmological constant tuned anyway
but problems not linked [weakless universe': Harnik, Kribs, Perez]
 - or new physics at TeV scale:
 - supersymmetry [my favorite]
 - extra dimensions [cool idea]
 - little Higgs [old idea, now working]
 - composite Higgs, no Higgs... [tough]
- ⇒ fundamental Higgs without TeV-scale completion useless

Standards of model building

- many new states around the TeV scale [subject to experimental constraints]
 - discrete symmetry for e-w precision constraints, proton decay
 - stable lightest new particle: dark matter [weakly coupled, below TeV range]
 - additional symmetries for flavor constraints
- ⇒ general: TeV-scale models in baroque state

Effective Standard Model in the LHC era

Expectations from the LHC [Uli Baur's rule: 'there is always new physics at higher scales']

- find light Higgs?
- find new physics stabilizing Higgs mass?
- see dark-matter candidate?

Particle theory and new physics

- model-independent analyses likely not helpful
- testing testable hypotheses [theory: e.g. Higgs sector and underlying theory?]
discrete hypotheses: spins,...
continuous hypotheses: masses,...
- link to other observations [DM+Tevatron: Hooper, TP, Valinotto]
- reconstruction of Lagrangian [theory+experiment]

TeV-scale supersymmetry

Supersymmetry

- give each Standard-Model particle a partner [different spin, valid to all orders]
 - SUSY obviously broken by masses [soft breaking, mechanism unknown]
 - sooo not an LHC paradigm: maximally blind mediation [MSUGRA, CMSSM]
 - scalars — m_0
 - fermions — $m_{1/2}$
 - tri-scalar — A_0
 - Higgs sector — $\text{sign}(\mu)$, $\tan\beta$
 - assume dark matter, stable lightest partner
- ⇒ measure BSM spectrum with missing energy at LHC

TeV-scale supersymmetry

Underlying parameters

From kinematics to weak-scale parameters [Fittino; SFitter: Lafaye, TP, Rauch, Zerwas]

- parameters: weak-scale Lagrangian
- measurements: kinematic endpoints, rates, flavor, dark matter,...
- errors: general correlation, statistics & systematics & theory [flat theory errors!]
- problem in grid: huge phase space, no local maximum?
problem in fit: domain walls, no global maximum?
problem in interpretation: bad observables, secondary maxima?

Probability maps of new physics [Baltz,...; Roszkowski,...; Allanach,...; SFitter]

- fully exclusive likelihood map $p(d|m)$ over m [hard part]
- LHC problem: remove pathetic directions [e.g. endpoints or dark matter vs rates]
- Bayesian: $p(m|d) \sim p(d|m) p(m)$ with theorists' bias $p(m)$ [cosmo, BSM]
frequentist: best-fitting point $\max_m p(d|m)$ [flavor]
- LHC era: (1) compute high-dimensional map $p(d|m)$
(2) find and rank local maxima in $p(d|m)$
(3) Bayesian–frequentist dance to reduce dimensions

Spins from cascades

Elegant LHC universe [Alves, Eboli, TP; like Cambridge squarks]

- remember: spins mean angular correlations
- ‘invariant angles’: $m_{j\ell}/m_{j\ell}^{\max} = \sin \theta/2$
- squark: production asymmetry $p p \rightarrow \tilde{q}/\tilde{q}^* + \tilde{g}$

$$\mathcal{A}(m_{j\ell}) = \frac{\sigma(j\ell^+) - \sigma(j\ell^-)}{\sigma(j\ell^+) + \sigma(j\ell^-)}$$

Spins from cascades

Elegant LHC universe [Alves, Eboli, TP; like Cambridge squarks]

- remember: spins mean angular correlations
- 'invariant angles': $m_{j\ell}/m_{j\ell}^{\max} = \sin \theta/2$
- squark: production asymmetry $pp \rightarrow \tilde{q}/\tilde{q}^* + \tilde{g}$

$$\mathcal{A}(m_{j\ell}) = \frac{\sigma(j\ell^+) - \sigma(j\ell^-)}{\sigma(j\ell^+) + \sigma(j\ell^-)}$$

- gluino decay asymmetry b vs. \bar{b}
- b vs. \bar{b} : example for advanced LHC requirement
- stable w.r.t production channels and cuts

- squark: production asymmetry $pp \rightarrow \tilde{q}/\tilde{q}^* + \tilde{g}$

$$\mathcal{A}(m_{j\ell}) = \frac{\sigma(j\ell^+) - \sigma(j\ell^-)}{\sigma(j\ell^+) + \sigma(j\ell^-)}$$

- gluino decay asymmetry b vs. \bar{b}

$$\mathcal{A}(m_{\mu b}) = \frac{\sigma(bl^+) - \sigma(bl^-)}{\sigma(bl^+) + \sigma(bl^-)}$$

- b vs. \bar{b} : example for advanced LHC requirement
 - stable w.r.t production channels and cuts
 - unstable w.r.t model details
 - all messy once neutralinos and charginos involved
 - positive: use information [Hagiwara, Kim, Mawatari, Zerwas]
- ⇒ LHC only as good as understood hypotheses

Spins from jets

Illustrating testable hypotheses: spin of LSP [Alwall, TP, Rainwater]

- Majorana LSP with like-sign charginos?
 - hypotheses: like-sign charginos (SUSY)
like-sign scalars (scalar dark matter)
like-sign vector bosons (little-Higgs inspired)
 - chargino decay/kinematics not used
- ⇒ WBF : two key distributions $\Delta\phi_{jj}, p_{T,j}$ [like $H \rightarrow ZZ \rightarrow 4\mu$ or WBF-Higgs]

Weak boson fusion and unitarity

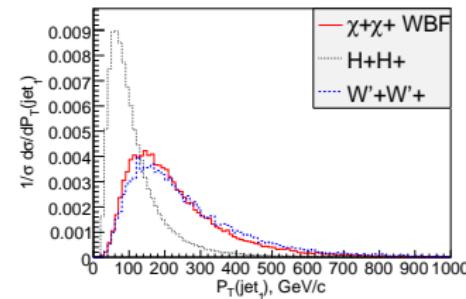

Like-sign scalars or fermions?

- charged Higgs in 2HDM
- H^+H^- same as simple H^0 [TP, Rainwater, Zeppenfeld; Hankele, Klamke, Figy]
- W radiated off quarks [Goldstone coupling to Higgs]

$$P_T(x, p_T) \sim \frac{1 + (1 - x)^2}{2x} \frac{1}{p_T^2}$$

$$P_L(x, p_T) \sim \frac{(1 - x)^2}{x} \frac{m_W^2}{p_T^4}$$

⇒ scalars with softer $p_{T,j}$

Weak boson fusion and unitarity

Like-sign scalars or fermions?

- charged Higgs in 2HDM

- W radiated off quarks [Goldstone coupling to Higgs]

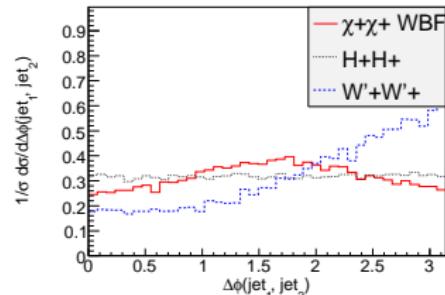

$$P_T(x, p_T) \sim \frac{1 + (1 - x)^2}{2x} \frac{1}{p_T^2}$$

$$P_L(x, p_T) \sim \frac{(1 - x)^2}{x} \frac{m_W^2}{p_T^4}$$

⇒ scalars with softer $p_{T,j}$

Like-sign vectors or fermions?

- little-Higgs inspired
 - start with copy of SM, heavy W', Z', H', f' [H' necessary for unitarity, but irrelevant at LHC]
 - Lorentz structure reflected in angle between jets
- ⇒ vectors with peaked $\Delta\phi_{jj}$

$$P_L(x, p_T) \sim \frac{(1 - x)^2}{x} \frac{m_W^2}{p_T^4}$$

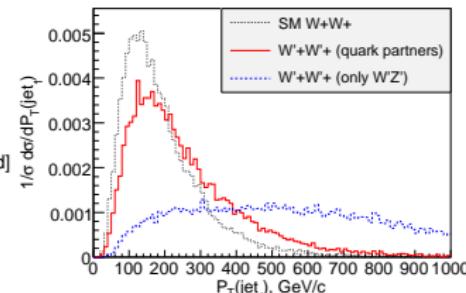

⇒ scalars with softer $p_{T,j}$

Like-sign vectors or fermions?

- little-Higgs inspired
 - start with copy of SM, heavy W' , Z' , H' , f' [H' necessary for unitarity, but irrelevant at LHC]
 - Lorentz structure reflected in angle between jets
- ⇒ vectors with peaked $\Delta\phi_{jj}$

Heavy fermions in little-Higgs models

- part of unitary UV completion [Englert, Zeppenfeld]
 - huge effects on distributions [at low scales]
- ⇒ more like strongly interacting Ws

New physics at the LHC

TeV-scale new physics at LHC

- know there is BSM physics [dark matter,...]
- solve hierarchy problem
- explain dark matter

Understanding the TeV scale

- (0) avoid getting killed by QCD
 - (1) look for solid new-physics signals [missing energy?]
 - (2) test sensible new-physics hypotheses
 - (3) measure weak-scale Lagrangian [highD parameter spaces?]
 - (4) determine fundamental physics [supersymmetry just example]
- ⇒ LHC more than a discovery machine!
